FOR MENTAL DISORDERS,
NORTHAMPTON.

FOR THE UPPER AND MIDDLE CLASSES ONLY

President THE MOST HON. THE MARQUESS OF EXETER C.M.G. V.D.C.

Medical Superintendent DANIEL F. RAMBAUT M.A., M.D.

This registered Hospital is situated in 120 acres of park and pleasure grounds. Voluntary Boarders (persons suffering from incipient nervous and mental disorders as well as certified patients of both sexes) are received for treatment. Careful clinical, biochemical bacteriological and pathological examinations. Private rooms with special nurses, male or female, in the Hospital or in one of the numerous villas in the grounds of the various branches can be provided.

WANTAGE HOUSE

This is a Reception Hospital in detached grounds with a separate entrance to which patients and voluntary boarders can be admitted. It is equipped with all the apparatus for the most modern treatment of Mental and Nervous Disorders. It contains special departments for hydrotherapy by various methods including Turkish and Russian baths, the prolonged immersion bath, Vichy Douche, Scotch Douche, Electrical baths, Plombieres treatment etc. There is an Operating Theatre, a Dental Surgery, an X-ray Room, an Ultra-violet Apparatus, and a Department for Diathermy and High Frequency treatment. It also contains Laboratories for biochemical, bacteriological and pathological research.

MOULTON PARK

Two miles from the Main Hospital there are several branch establishments and villas situated in a park and farm of 650 acres. Milk, meat, fruit and vegetables are supplied to the Hospital from the farm, garden and orchards of Moulton Park. Occupation therapy is a feature of this branch and patients are given every facility for occupying themselves in farming, gardening and fruit growing.

BRYN-Y-NEUADD HALL

The seaside house of St. Andrew's Hospital is beautifully situated in a Park of 330 acres at Llanfairfechan, amidst the finest scenery in North Wales. On the North West side of the Estate a mile of sea coast forms the boundary. Voluntary Boarders or Patients may visit this branch for a short seaside change or for longer periods. The Hospital has its own private bathing house on the seashore. There is trout fishing in the park.

At all the branches of the Hospital there are cricket grounds, football and hockey grounds, lawn tennis courts (grass and hard courts), croquet grounds, golf courses and bowling greens. Ladies and gentlemen have their own gardens and facilities are provided for handicrafts such as carpentry, etc.

For terms and further particulars apply to the Medical Superintendent (Telephone No. 56 Northampton) who can be seen in London by appointment.

ALIMENTARY TOXAEMIAS

PUTREFACTIVE bacteria increase in numbers in the intestine as age advances, They are relatively scanty in the young child, but after middle life are usually present in considerable numbers Of the micro-organisms concerned, proteolytic anærobes are probably the most important

In individuals with a normal intestine and free evacuations, they may do little harm, but in those subject to intestinal catarrh, these putrefactive bacteria become more numerous and active, their products are formed in greater quantity, and are more freely absorbed, and the condition of alimentary toxæmia results The manifestations of this state are very protean, *e g*, "rheumatic" conditions, digestive upset, neurasthenia and neuralgias, increased blood pressure and its complications, and many others The treatment, in the first place, obviously should be *intestinal disinfection* For this purpose nothing surpasses the use of KEROL CAPSULES They have solved for years the question of disinfection of the alimentary tract They definitely reduce the bacterial content of the intestine, as shown by the reduction in *B coli* by 99% when the capsules are regularly administered for a period of from seven to ten days We have from time to time published several booklets containing clinical evidence as to their value, and these we will gladly forward, on receipt of a postcard, to any member of the Medical Profession

Intestinal Disinfection

Please send for Literature and Samples, which will be sent free to any member of the Medical Profession.

Diphtheria Antitoxin

(Parke, Davis & Co.)

¶ Parke Davis & Company have been engaged in the preparation of serums and antitoxins since 1894. Many years experience coupled with the possession of ample facilities and the collaboration of specially trained scientific workers place the firm in a particularly favourable position for the supply of thoroughly trustworthy preparations of this class.

A constant effort has been made to improve upon past achievements. Special study has been directed towards the elucidation of many problems affecting the quality of an antitoxin—the most suitable culture media method of producing toxin of highest virulence immunising procedure reduction in volume of the dose and also the elimination of undesirable proteins—in all these matters great improvement has been effected.

¶ Diphtheria Antitoxin (P. D. & Co.) is unsurpassed as regards water-whiteness sparkling transparency and low content of solids. Of even greater moment is the reduction to a remarkably small percentage of those protein elements of the serum which are held to be responsible for serum sickness and kindred protein disturbance.

¶ Two grades of Diphtheria Antitoxin (P. D. & Co.) are offered, viz. Standard and Special. These differ only in the volume in which the same number of antitoxin units is presented. The "X" or "Standard" serum contains approximately 1,500 antitoxin units per c.c. "XX" or Special serum 2,250 to 2,750 antitoxin units per c.c.

A copy of Serum Therapy—a 64-page brochure describing Parke Davis & Co's serums and antitoxins—will be sent on request

PARKE DAVIS & COMPANY [illegible] 50 BEAK ST. LONDON W.1

Sedare dolorem opus divinum est.
—HIPPOCRATES

The Power of Relieving Pain is a Specific Property of Thermotherapy

Due to its ability to maintain moist heat for a long time

Antiphlogistine

relieves local congestion, and breaks down a vascular stasis. It causes an inhibition of the sensory nerves, thus relieving pain by acting through the thermal nerves of the skin

Antiphlogistine is an analgesic, depletant and supportant measure for inflammatory conditions associated with pain and discomfort

Antiphlogistine retains its heat for from twelve to twenty-four hours, thus obviating the necessity for frequent changes occasioned by other forms of poultices.

YOU PRESCRIBE LIGHT ABSORBENT UNDERWEAR WINTER AND

No medical man would ever recommend heavy, stuffy fabrics worn next to the skin as a protection against cold He knows that anything which fails to allow the impurities in the air round the body to escape—anything which fails to absorb perspiration—is definitely harmful Some form of light porous texture is essential for combining warmth with health And it is for that very reason that Jaeger underwear—made of Jaeger pure wool—is so often recommended as the healthiest underwear for all seasons. All Jaeger underwear is replaced if it shrinks

Both for general and local application

—a wealth of expert evidence on the progress of Actinotherapy

offered to you by specialists in equipment for this field

AS a general tonic treatment, as a specific in rickets, and as a curative means in certain forms of tuberculosis, anæmia, etc—actinotherapy is regarded as a most valuable addition to the armoury of present day medicine by an ever increasing number of the most highly qualified men Difficulty, however, is often experienced in obtaining up to date information of the latest developments in this field—facts and figures relating to recent successes in this country and elsewhere

It is not unnatural that the Hanovia Company, who have specialised exclusively in the manufacture of actinotherapy equipment for over 25 years, and have supplied over 167,000 Quartz Lamps for medical purposes in all parts of the world, should possess a most complete record of all such progress

In the Hanovia Company you have a clearing house, an authoritative collection of all available facts ready to supply your needs, if you are interested in or practising actinotherapy

From whatever point of view you may be interested, Hanovia can supply you with the fullest information You place yourself under no obligation whatever by writing to the address below, stating what special branch of work is most likely to interest you

WRITE TO-DAY FOR DETAILS OF THE HANOVIA REPRINT SERVICE

Hanovia data is divided under the following heads —General Practice, General Surgery, Public Health Work, Tuberculosis, Pediatrics, Dermatology, Gynæcology, Oto Laryngology, etc, etc Over one hundred reprints of these and other subjects are available for free distribution to the Medical Profession A full list of these will be sent to you together with copies under any heading of special interest to you Write for this list to day Mark the enquiry Dept 9

An Effective Ally in the Treatment of Pneumonia

Anything short of major calibre in a diathermy machine for the treatment of pneumonia will prove disappointing. The Victor Vario-Frequency Diathermy Apparatus is designed and built specifically to the requirements. It has first the necessary capacity to create the desired physiological effects within the heaviest part of the body; secondly a refinement of control and selectivity unprecedented in high frequency apparatus.

A REPORT from the Department of Physiotherapy of a well-known hospital, dealing with diathermy in pneumonia and its sequelae, states as follows:

"As a rule diathermy is indicated in acute pneumonia especially so when the symptoms are becoming or already are alarming: the temperature is high, the patient is delirious, the pulse is extremely rapid, cyanosis is deep, the respiration rate is high, the breathing is very shallow, and the cough remains unproductive. Not infrequently in a pneumonia case with such alarming symptoms after a few diathermy treatments an entire change of the picture takes place: cyanosis lessens, respiration becomes deeper, the quality of pulse improves, the rate decreases, the temperature is lowered, and the cough becomes productive. Auricular fibrillation that develops occasionally in similar pneumonias or other types of pneumonia where the toxaemia is great has been changed to a perfect normal rhythm after a few diathermy treatments."

You will value diathermy as an ally in your battles with pneumonia at this season, aside from the satisfaction derived from having utilized every proved therapeutic measure that present-day medical science offers.

The simplest known method of making drinking water SAFE

1 Inlet. 2 Outlet 3 Drain

No chemicals
No trouble
No risk

HERE is an entirely new method of treating drinking water and making it safe The Catadyn method offers the following unique advantages

1 No attention required The sterilising elements supplied will deal with several millions of gallons
2 No possible risk of overdosage
3 The colour, taste, and smell of the water are not impaired—in fact the taste of flat water is improved, as the treatment leaves the water richer in oxygen
4 The treated water is bactericidal, and is thus able to resist further infection

The illustration shows a plant installed in a large country mansion in England The outlet is connected to the supply tank through a ball valve The plant operates continuously, dealing with the supply of the entire household The tables below give the results obtained

	RAW WATER	TREATED WATER drawn off as it leaves the outlet on Catadyn Steriliser
Number of organisms per c c of water growing in nutrient gelatine at 20°C in three days	288	———
Number of organisms per c c growing upon agar at 37°C in one day	33	———
Smallest quantity of water giving acid and gas in bile-salt glucose broth	1 c c	Absent in 100 c c
Smallest quantity of water giving gas in bile salt lactose broth	1 c c	Absent in 100 c c
Smallest quantity of water containing the Bacillus Coli	Present in 10 c c Absent in 1 c c	Absent in 100 c c
Smallest quantity of water giving the reaction of the B Welchii (Bacillus Enteritidis Sporogenes)	Absent in 100 c c.	Absent in 100 c c.
Note—This water shows bacterial evidence of *slight contamination*		*Note*—This is a clear and bright water of the *highest* degree of bacterial purity It is a pure and wholesome water suitable for drinking and domestic purposes

The British Catadyn Company desire to secure the investigation of this remarkable invention by the Medical Profession and are prepared to send a small steriliser for test purposes upon request to the address below

GREYCOAT STREET, WESTMINSTER, S W

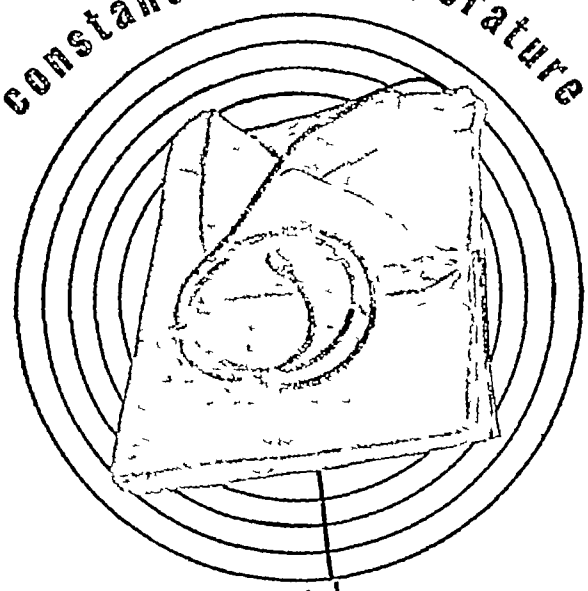
Monday, Tuesday, Wednesday, Thursday and Friday,
October 20, 21, 22, 23 and 24, 1930

From 12 noon till 6 30 p m Daily

Organised by the Management of the Exhibition of the 17th International Congress of Medicine, 1913, and of the Fifth Clinical Congress of Surgeons 1914.

NEW
AND
IMPORTANT
EXHIBITS

EXHIBITION BUILDINGS.



STRICTLY
CONFINED
TO THE
PROFESSION

The change of venue made last year, which had become necessary in the interests of both Visitors and Exhibiting Houses, was much appreciated The New Hall of the Royal Horticultural Society is a magnificent structure offering every modern advantage and specially suitable for a Professional Exhibition.

The exhibits, all on one level, will be more numerous and varied even than in the past A number of new medicinal substances and preparations, surgical instruments and medical appliances, also hospital equipment, will be on view for the first time in this country A spacious and well fitted Reception Room overlooks the Exhibition Hall, and here an orchestra will perform each day and visitors will be entertained to afternoon tea.

Invitation cards have been sent to every member of the Profession residing in London and in Counties adjacent thereto Practitioners desiring to visit the Exhibition who do not receive cards can obtain same on application to the Secretary, The London Medical Exhibition, 194-200, Bishopsgate, London, E.C.2, or at the Hall during the Exhibition week

constant bed temperature electrically maintained

With THERMEGA ELECTRIC BLANKETS and PADS, constant regulated heat can be supplied to beds immediately from any wall plug or lamp socket on any voltage (100—250)

A THERMEGA BLANKET will warm and air a bed all through well within the hour Thus all risk of rheumatism is avoided By means of the THERMEGA PAD, steady warmth can be applied locally at a moments notice, and maintained for as long as is desired The pad is no larger than an ordinary hot-water bottle

Then average cost of current works out at 1d an hour (at 6d a unit) By a special Thermostat device the heat is constantly regulated and overheating made impossible Prices from 33/- complete

Intestinal Debility

Cristolax is worthy of careful trial in all cases of constipation It is composed of 50 per cent. of the purest medicinal paraffin in combination with 50 per cent. of Wander Dry Malt Extract The paraffin content acts mechanically for expelling the fæces while the high diastatic property of the malt extract assists digestion and improves nutrition

Where the patient has been accustomed to use an ordinary laxative regularly it is recommended that this should be continued in diminishing doses with the Cristolax treatment It is quickly found that the Cristolax method of intestinal lubrication will alone ensure adequate and regular defecation

Patients highly approve the pleasant flavour of Cristolax the complete absence of oiliness and its cleanly form

Invaluable as a Galactagogue

This nourishing and sustaining food drink is helpful to nursing or expectant mothers

NOT only hundreds, but literally thousands of cases are recorded in which this well-known preparation — Horlick's Malted Milk — has proved its efficiency as a body-building food

It is particularly valuable as an addition to the diet of the expectant and nursing mother For Horlick's is a perfectly balanced food containing fat, proteins and soluble carbohydrates combined together in correct nutritive ratio It is prepared from fresh, full-cream cows' milk, selected wheat and malted barley — and, during manufacture, is partially predigested to ensure easy assimilation

Horlick's is rich in valuable malt-sugars, but contains neither cane sugar nor free starch It is therefore extremely easily digested, and highly productive of energy

These characteristics make it valuable as a galactagogue Its abundant nutriment supplements any deficiencies in the mother's regular diet, and promotes a regular and nourishing supply of milk, and its easy digestibility makes it acceptable when other forms of nourishment are unwelcome

Taken during pregnancy, it builds up the mother and helps to maintain her vitality A cupful taken regularly first thing in the morning frequently abolishes and almost invariably alleviates the discomfort of morning sickness

Horlick's is now obtainable in two forms — the original, natural-flavoured Malted Milk, and the new Chocolate Flavoured form — identical in its constituents with the original Horlick's, but flavoured with fine chocolate Horlick's is sold in sealed glass bottles, price 2/-, 3/6, 8/6, 15/- Also in tablet form

Further details may be obtained from Horlick's Malted Milk Co, Ltd, Slough, Bucks

HOW GIBBS HELPS THE DOCTOR

He can confidently recommend Gibbs Dentifrice as a safe, sure, mild dentifrice for all

Gibbs Dentifrice lives up to all that any Doctor would wish a dentifrice to be and do He is safe in recommending Gibbs Dentifrice because it is a mild, gentle, yet efficient cleansing agent which will not harm even the most delicate mouth, or scratch the finest enamel

Gibbs Dentifrice conforms to the findings of the most recent scientific research in the field of dental prophylaxis

Gibbs Dentifrice approximates the ideal dentifrice, since it meets the following conditions:

It is of a consistency and composition calculated to discourage the further accumulation of mucous plaques and other deleterious material upon and around the teeth, and leaves the surface of the enamel brilliantly polished

It is non-irritating and harmless in its reaction upon the delicate mucous membrane of the mouth

It is free of any decalcifying action upon the tooth substance

It is mildly alkaline and tends to correct any acid reaction in the mouth It has mildly antiseptic properties which check and retard sepsis in the mouth These properties also assist in keeping the toothbrush sweet and clean

It is in a convenient form for use, and has a pleasant taste and flavour, and leaves a clean and refreshed feeling in the mouth

GIBBS DENTURE TABLET

Gibbs new Denture Tablet is for cleaning Dental Plates Bridgework (both gold and vulcanite) and artificial teeth It gives a high polish, removes stains, makes plate or teeth sterile and antiseptic without in any way injuring the softest gold or the finest vulcanite or platinum. The formula has been submitted to and approved by important members of the Medical Profession.

MEDULLA RUBRA

BONE-MARROW IN ANAEMIA FROM HAEMORRHAGE

W Borchardt (*Deut med. Wschr* March 28th 1930 P 521) records the results of his experiments on young dogs in which anaemia had been artificially produced by the removal of about half their blood. In the first series some of the animals were fed with rib-marrow others with marrow from the long bones Control animals received a corresponding amount either of at or of liver extract The basal diet in each case contained a sufficiency of iron (5 mg per cent). Only the animals receiving the rib-marrow showed a definite increase of weight and their haemoglobin formation was more rapid than that of the others In the next series the experiment was repeated, but the iron content of the diet was reduced to 1 4 mg per cent.). Only the animals receiving the rib-marrow striking the dogs receiving the rib-marrow regaining their haemoglobin far more quickly than the others

THIS extract from the "Epitome of Literature," published in the BRITISH MEDICAL JOURNAL,' dated May 3rd last is important as representing in 1930 a complete justification of the formula upon which

Poboleine

THE FOOD THAT BUILDS THE BODY

has been produced without variation during the past twenty five years.

The success of ROBOLEINE is thus due to intelligent anticipation and to consistently maintaining the highest possible standard of manufacture

Medical Practitioners are asked to satisfy themselves of the merits of ROBOLEINE for which purpose testing samples will be gladly sent upon request.

A POWERFUL SAFE GERMICIDE

THE mere statement that the R W coefficient of an antiseptic is 2 20, or even 50, is of little value in estimating its usefulness for any variety of purposes The test organism employed in this method is B Typhosus, and an antiseptic which will kill this organism in high dilution will not necessarily kill others under similar conditions

The coal-tar group of antiseptics has a selective action on bacilli of the typhoid-coli group, with the consequence that Rideal-Walker coefficients for these products are remarkably and deceptively high If the same test is performed using a variety of other organisms it will commonly be found that there are no two distinct varieties for which the coefficient is the same

The selective action of Monsol differs from that of any other antiseptic known Perhaps its most valuable action is on the Streptococcus Pyogenes, which Monsol destroys at dilutions 10 times greater than those at which phenol or lysol are effective

Monsol is bland in action and in therapeutic concentrations non-irritant even to mucous membranes

BY APPOINTMENT

IN SEVERE ILLNESS . . .

IN CONVALESCENCE . . .

THESE ESSENCES RESTORE VITALITY

AND STIMULATE THE APPETITE

RECENT investigation proves that 99 *out of every* 100 *doctors interviewed* recommend Brand's Essences in cases where the need for an easily assimilated food is imperative!

Absorption by the digestive system is so rapid that, in states of extreme exhaustion, they restore vitality almost immediately And during convalescence, when the very thought of ordinary food is repugnant, these Essences help to stimulate the appetite and create a desire for the solid diet which is so vital to recovery

For Brand's Essences consist entirely of the pure juices of the finest fresh meat—conserved in their natural form — a delicious jelly Nothing is added which could prevent easy assimilation—no flavouring, no gelatine, no colouring

Brand's Essences are obtainable at chemists and stores throughout the world in tins and glasses A professional card will bring you samples of the Essences immediately Write Dept. F14, Brand & Company Limited, Mayfair Works, Vauxhall, London, S W 8

OUT OF EVERY 100 DOCTORS RECENTLY INTERVIEWED 99 RECOMMEND

BRAND'S ESSENCES

(Made only from the finest English Beef, Chicken or Mutton)

A palatable combination of Lactose & Dextrin

for changing the intestinal flora

Lactose 73%, dextrin 25%—that is the proportion in which these carbohydrates are combined in this new food for changing the intestinal flora Both are more slowly absorbed than other carbohydrates, and both are able to reach the colon in sufficient quantity to cause a luxuriant growth of protective flora An acid reaction of the intestinal contents unfavourable to toxic organisms is thus produced —Lacto-Dextrin being highly efficient in promoting the growth and development of both B acidophilus and B bifidus in the colon In this pure carbohydrate food both lactose and dextrin are presented in a palatable and agreeable combination

PSYLLA

an accessory for use in conjunction with Lacto-Dextrin

Where bulk and lubrication of the intestinal tract is also required, the use of BATTLE CREEK Psylla (Plantago Psyllium) is invaluable as an accessory The small brown seed when in contact with water swells into a soft gelatinous mass and acts most effectively both as an emollient and intestinal evacuant

Samples and literature of both these intestinal products will be sent to members of the Medical Profession on request to Coates & Cooper, 41 Gt Tower St, London E C 3, Sole Distributing Agents for the United Kingdom and Irish Free State

LACTO-DEXTRIN

Manufactured by the BATTLE CREEK FOOD CO, Mich, U S A

The Prevention and Treatment of Sepsis

Issued in Powder in Tablets and in Solution

In the prevention and treatment of sepsis it is essential that the antiseptics employed should be highly germicidal and, at the same time safe in use.

These attributes combined in a remarkable manner in Acriflavine B D explain why this antiseptic has enjoyed for some fifteen years the confidence of the physician and surgeon

Acriflavine B D is strongly recommended in general surgery (*B M J*, 1930 I 822) further it is considered by many to be the ideal antiseptic for use in the treatment of gonorrhoea since it is highly toxic to the gonococcus and yet harmless to the host

MALNUTRITION and MARASMUS

Mellin's Food when given in conjunction with cow's milk and water produces an immediate gain in weight in fermentative dyspepsia and in wasting disorders of early infancy For the prematurely born infant Mellin's Food proves invaluable

As is well known, sugars exhibit varying tendencies to fermentation in the digestive organs Milk sugar ferments most rapidly less rapidly cane sugar and maltose still more slowly, and the high percentage of dextro-maltose in Mellin's Food accounts for its usefulness in all such cases of malnutrition

Mellin's Food

The booklet "Modified Milk in Infant Feeding" deals fully with the use of Mellin's Food in cases of malnutrition, and will be gladly sent together with samples to Members of the Medical Profession.

MELLIN'S FOOD LTD., LONDON, S.E.15.

Another Success for Humanised Trufood

The difficult cases of infant feeding prove the worth of this "nearest-to-Nature" diet

Mrs Griffiths, 34 Downshall Avenue, Seven Kings, Essex, writes —

"I am sure you will be very interested to hear of my little daughter's wonderful progress on Humanised Trufood

"When she was born on February 1st this year she only weighed 3¼ lbs Apart from her smallness we were both given up, as during the time of her birth I was suffering very badly with Eclamsia According to my own doctor and the doctors in Hospital this is a very terrible complaint and few recover They tell me only one baby in 400 lives

"However, here we both are and I have one of the bonniest babies that one could wish for She now weighs over 10 lbs and is perfectly strong and healthy She has been reared on Humanised Trufood as I have been unable to feed her myself"

The evidence of clinical observation is constantly proving the superiority of Humanised Trufood May we send you samples and literature?

Benger's Food—*the adjustable diet.*

The "LANCET" describes it as "Mr Benger's admirable preparation."

Owing to the presence of the natural enzymes of digestion (*Amylopsin* and *Trypsin*), and its method of preparation for a patient, the extent of self digestion of Benger's Food and the milk with which it is mixed *can be regulated to suit the digestive powers of the patient*

Benger's Food is prepared with fresh cows milk. It forms a dainty cream which becomes the easier of digestion the longer it is allowed to stand after mixing The process may be arrested at any time by simply bringing the mixture to the boil. (A useful average time for standing is 15 minutes)

Patients ordinarily unable to digest milk can take this mixture satisfactorily, as the Benger's food so softens the casein that when under the influence of the gastric juice it forms into minute flocculi instead of a heavy curd

Benger's Food is of the highest nutrient value and is not found to pall, even when taken over long periods

A Physician's Sample will be sent post free to any member of the Medical Profession making application to the Proprietors—

EXTRACT FROM THE AL-HAWI OR CONTENT OF MEDICINE" COMPILED BY RHAZES THE ARABIAN PHYSICIAN.—The al-Hawi was one of the chief sources of medical knowledge throughout the Middle Ages and contains many extracts from the great writers on Medicine. The accounts of the clinical cases of Rhazes constitute the most interesting content" in the whole work, for this physician was an exceptionally accurate and discerning observer He carefully records the name of the patient, the symptoms treatment and results obtained. One of his aphorisms reveals his attitude and reminds us of the close dependence upon ancient "authority which hindered advance in scientific medicine—

Truth in Medicine he writes is an unattainable goal and the art as described in books is far beneath the knowledge of an experienced and thoughtful physician."

CALCIUM-SANDOZ

$(C_6H_{11}O_7)_2$ Ca

Unique Advantages:

1.—It is effective. It supplies the physiologically active calcium ion.

2.—It shows distinct superiority in all modes of administration.

ORALLY It is well absorbed It is easily administered and does not upset the digestive tract

INTRAVENOUSLY It is better tolerated than calcium chloride The acid-base factor is eliminated

INTRAMUSCULARLY It is painless and non-irritating It is the only calcium salt which can be so administered in adequate doses

3.—It enables physicians to adequately meet the requirements of any given case.

BY VEIN, for acute need
BY MUSCLE, to secure intense and prolonged action
BY MOUTH, for prolonged administration, to meet an increased demand by the organism

4.—It is completely sufficient in itself as a therapeutic agent.

CALCIUM-SANDOZ is supplied in

Ampoules containing a 10% sterile solution for intravenous or intramuscular injection
5 c c size Boxes of 2 and 10 ampoules
10 c c size Boxes of 1, 5, and 20 ampoules

Powder for oral administration —Cartons of 2, 4, and 16 ounces

Tablets for oral administration —Each tablet contains 25 grains of calcium gluconate and is especially adapted for division into three parts Boxes of 30 and 150 tablets Cartons containing 12 boxes of 30 tablets

Observations on THE SYMPATHETIC NERVOUS SYSTEM*

BY

W. J. MAYO, M.D., LL.D., F.R.C.S. (Hon.)

ROCHESTER, MINNESOTA

'He that does not go beyond the facts will seldom get as far as the facts.' (Huxley) In research this axiom tells the story. Starting by deductions from facts, scientific imagination develops hypotheses, which are proved or disproved through that form of inductive philosophy which we call research. Although we desire positive results, negative results have value, and often negativity itself starts a new deduction which leads to the truth. The history of our understanding of the sympathetic nervous system well illustrates the value of both positive and negative scientific contributions.

Anatomical Landmarks

Petit (1724) pointed out that stimulation of cervical sympathetic nerves caused dilatation of the pupil, and Winslow (1732) deduced from measurements that the sympathetic nerves did not arise from the cranial nerves. Haller (1757–1766) first discovered the rami communicantes, which marked a great step forward in our knowledge of the sympathetic nervous system. Remak (1838) discovered that there were two types of fibre in the system, the medullated or pre-ganglionic, and the non-medullated or post-ganglionic; and Müller (1840) contributed a theory as to their respective functions. The splendid research of Gaskell, published in 1885, put our anatomical knowledge of the sympathetic nervous system on a sound basis; and Langley and Dickinson (1895) followed with new knowledge of the pelvic part of the parasympathetic system.

Physiological Landmarks

For a long time Bichat's theory (1830) held the field—that is, that the cerebro-spinal system brought us into contact with the outside world, but that the sympathetic system regulated the nutrition of the body. This was finally disproved by Gaskell's demonstration of the interrelation between the two systems, aided by the method, published by Langley and Dickinson (1889), of distinguishing between pre-ganglionic and post-ganglionic fibres by the use of nicotine. Experimental work on the physiology of the sympathetic nervous system dates from 1851, when Claude Bernard discovered that when the sympathetic nerve is cut in the neck of a rabbit the blood vessels in the ear of the same side become much dilated. Since then the fundamental work of the Cambridge school of physiologists has been followed in Europe by that of Jaboulay, Leriche, Jonnesco, Danielopolu, Förster, and Brüning in Australia by that of Hunter, Royle, and Wade; and in America by that of Kunz and Cannon. The contributions of Hunter and Royle led to the remarkable recent advance in our working knowledge of the sympathetic nervous system, the practical application of which has had most encouraging results.

Autonomic Nervous System and Endocrine Glands

While we are thrilled with these researches, and by the surgical adventures which they have stimulated in the practical application of their results to disease, let us not lose sight of the autonomic nervous system as a whole of which the sympathetic system is only a part. Moreover, the endocrine glands, chiefly the thyroid gland, the suprarenal glands, and the hypophysis are in close functional association with the sympathetic nervous system, and the suprarenal glands and hypophysis contain cells derived from the *anlage* of the nervous system. Studies of the interrelation between the central nervous system, the sympathetic nervous system, and the internal secretions, hormones, vitamins, light rays, and other biochemical phenomena which have to do with foods, are contributing new knowledge of the human economy for application in medicine and surgery. In the short time at my disposal I shall touch lightly on a few problems, the solution of which depends on a better understanding of the physiology of the autonomic system.

Thyroid Gland

In the elucidation of the relation of iodine to disturbances of the thyroid gland we owe much to Marine and to Plummer. Plummer showed that, contrary to generally entertained views, the prescription of iodine would remove the immediate effects of the deleterious secretions of the excited thyroid gland, and would restore patients to a condition in which thyroidectomy, formerly a hazardous operation, became one of safety. Plummer also demonstrated that although iodine had this remarkable effect the improvement was to a large extent temporary, and that this drug was in no sense curative. The surgeon no longer depends on his own clinical knowledge in the diagnosis of thyroid disease, and decides on operation only when aided by the clinician and the metabolic laboratory.

Suprarenal Glands

Of great importance are the suprarenal glands and their different secretions from the cortex and from the medulla. The small medullated nerves which arise from the lateral horns of the spinal cord pass to sympathetic ganglions with the single exception that certain of these nerves pass to the suprarenal gland, where they are distributed to the cells of both cortex and medulla. In the last fifteen years the growth of knowledge of the function of the suprarenal glands has come through the work of clinicians and their co-workers in laboratories. With regard to bilateral organs, if one organ is intact it is sufficient for bodily purposes, and this is true of the suprarenal glands. In a number of cases I have removed a suprarenal gland because it was involved with a diseased kidney, and in subsequent clinical observation of the case I was not able to find that this procedure had any demonstrable effect on the patient.

Vascular Type of Sympathetic Dysfunction

These important glands, the thyroid gland and the suprarenal glands, are closely associated with the vascular phenomena of certain diseases which recently have been attacked through the sympathetic system. Thus Raynaud's disease has been definitely ameliorated by operations on the sympathetic ganglions and trunks; by the same procedure it is possible to check the progress of certain types of arthritis which lead to permanent crippling and to deformity, and of angioneurosis which gives rise to certain forms of scleroderma of the face, neck, and extremities. Patients suffering from thrombo-angiitis of the extremities have been benefited by removal of the appropriate sympathetic ganglions and trunks. It is not possible that chronic interstitial nephritis (Bright's granular nephritis) is the end-result of the same vascular type of sympathetic dysfunction? It has been shown that excision of its sympathetic nerves appears to have a marked influence on the congenital types of dilatation of the colon which are grouped under the general heading of Hirschsprung's disease.

Control of Visceral Functions

In considering the parasympathetic system one wonders whether the vagus nerves may sustain an unsuspected relationship between the emotions and the heart, just as one wonders about the exact relationship of Langley's pelvic nerves to certain obscure happenings in and around the bladder, the pelvic portion of the colon, and the rectum.

When one tries to visualize the various forms of local control one may postulate that smooth muscle fibre was among the very earliest of the self-controlled tissues.

[364r]

*Made in opening a discussion in the Section of Surgery at the Annual Meeting of the British Medical Association, Winnipeg, 1930.

Unstriated muscle may originate its own action, and within the limits of the influences which necessitate this action it is self-sufficient The ultimate source of this power, which carries on the vegetative functions, is molecular and colloidal energy released through enzyme action, as marvellous as the energy stored in radium Cathcart and Benedict estimate that only 25 per cent of the energy produced in the body can be expended by tissues under the control of the will, 75 per cent being used by the so-called vegetative functions of the body, of which we are unconscious

In the intramural plexuses, which to a large extent *control motion* in the gastro-intestinal tract, we see what might be described picturesquely as pre-sympathetic ganglions, and one might even suggest that this may be true of the sino-auricular node and the bundle of His in the heart In the unconscious control of visceral functions through the sympathetic and parasympathetic systems, and the related glands of interaction, one might imagine that the heart is still showing the effect of an early form of control, by primitive emotional centres which existed long before the intellectual organs developed

Psychic Influences

A supreme relationship originated in that shadowy day when hunger and fear, and love and hate, ruled the early ancestral state Perhaps the psychic influences of this relationship have lost none of their magic Our emotions and our capacity for acquiring knowledge are hereditary Emotions may be said to be the outgrowth of those experiences which we call instincts in the lower animals, reactions which existed before the development of true intellectual centres Unstriated muscle is unconsciously controlled, striated muscle is under conscious control But the heart is composed of a primitive type of striated muscle Does this indicate an ancient form of control by unidentified emotional centres? Does the anatomically low origin of the vagus nerve indicate such a primitive cardiac function? Note the direct connexion of the suprarenal glands with sympathetic nerves In other words, does stern control of the emotions throw stress on the heart, and lead to degeneration of its musculature and to coronary disease?

Do such speculations lead us to believe that by further refinements of diagnosis at the hands of physicians familiar with the electrocardiograph and with other methods of precision the surgeon will be enabled, in early cases of impending vascular disease of the heart, to relieve the strain on its muscle by division of nerve fibres or by extirpation of sympathetic ganglionic tracts? In susceptible persons, spasmodic constriction of the arteries in Raynaud's disease, scleroderma of vasospastic origin, and some types of arthritis, eventually leads to vascular obstruction How about the heart? Is angina pectoris a similar vasospastic phenomenon, and coronary and myocardial disease its end-result? In the final analysis, heredity may be found to be a controlling factor

From the Royal Victoria Hospital in Manchester attention has been called to the fact that a common cause of death among surgeons is disease of the heart, especially coronary stenosis, coming on in the latter part of the sixth and the early part of the seventh decade of life In all other respects the surgeon maintains his general health equal to others, and often post-mortem examination does not show evidence of other serious disease The tendency to death from heart disease is not confined to surgeons, but is common to all men who live lives of stress, in which stern control of the emotions is necessary It is true that much of the disability among surgeons is due to the fact that surgery is to a certain extent a handicraft, and that age and anxiety produce reduction in skill, but, after all, that is not the most serious consideration The keen clinician, as he grows in experience, becomes more and more valuable as age advances He is not exposed to those malign influences of anxiety and responsibility to the same extent as is the surgeon One might say that the clinician sees his patient drowning and throws him the best means of relief he has, but that the surgeon, in order to give relief, jeopardizes the patient anew

THE CLINICAL RESULTS FOLLOWING THE OPERATION OF SYMPATHETIC RAMISECTION *

BY

N D ROYLE, M D , CH M , F C S A ,

ORTHOPAEDIC SURGEON, LEWISHAM HOSPITAL, SYDNEY

SYMPATHETIC ramisection was introduced by me in October, 1923, for the treatment of spastic paralysis It followed upon experiments carried out to investigate the apparent failure of reciprocal innervation in spastic conditions The results of these experiments are recorded elsewhere[1]

De Boer had previously found that the normal tonus of the hind limb of the frog and the cat disappeared when the rami communicantes of the sympathetic ganglion were cut Other investigators obtained similar results, but I was unaware of these when I carried out my experiments

DISCUSSION OF TONE

When the limb was deprived of its sympathetic nerve supply it behaved differently to a normal limb in that it showed a loss of resistance to passive movements, in addition, it exhibited an inability to oppose gravity in the decerebrate, anæsthetized, and normal passive animal—that is, there was a loss of the posture-maintaining mechanism The different behaviour of a limb deprived of its sympathetic nerve supply was attributed to a loss of tone

There is considerable controversy about the exact nature of tone, and a definition is difficult to give, but the definition that I use is that tone is the expression of a proprioceptive mechanism subserving posture, and is present in muscles which have been stretched or are being stretched—that is to say, it is not exhibited to any extent by muscles at rest

Over this mechanism of tone we have no conscious control except as a concomitant to active contraction There is a small amount of tone in a normal muscle which is overcome by the contraction of the opposing group, but is not directly inhibited Though I do not subscribe to the idea of co-contraction, tone is certainly induced by stretching the opposing group in any movement

The upper eyelid maintains a definite posture in the waking stage in response to the stretching imposed by gravity We cannot voluntarily make this *posture* any more fixed or any less fixed, but the tone is not sufficient to impede movement in changing the position of the lids If through some pathological change tone becomes *abnormally* increased, as it does in spastic paralysis, it not only increases the tendency to maintain posture, as is shown by the persistent attitudes of spastic hemiplegia, or by the inability to balance in spastic paraplegia on account of rigid limbs, but it also forms an obstruction to movement There is an apparent failure of reciprocal innervation due to an increase in tone in opposing groups of muscles For example, the excessive tone of the flexors of the elbow or knee induced by stretching cannot be inhibited when the extensors are contracting Although this may not appear in the laboratory animal, it does in the intact human subject

The chief indication for the operation of sympathetic ramisection is the failure of inhibition in voluntary muscles This is expressed by delayed relaxation time in reflexes, as in the knee-jerk, and by the inability to relax the muscles quickly There must also be present definite cortical control over the muscle group for the operation to be effective The essential change following a ramisection is that the patient no longer has to inhibit the excessive tone of his formerly contracted hypertonic muscles if cortical control is present Sympathetic ramisection does not remove contractures of fibrous tissue, nor does it restore cerebro-spinal pathways It decreases tone, and thus enables patients to move smoothly and more rapidly Movements are gained or regained as a result of operative treatment, as in the intrinsic muscles of the hand or the common extensors of the fingers, because the patient is

* Read in opening a discussion in the Section of Surgery at the Annual Meeting of the British Medical Association, Winnipeg 1930

able to relax the opposing group The relaxation of flexion of the fingers, for example allows extension to be performed (This statement does not apply in athetosis)

Results in Various Spastic Conditions

I have now performed the operation of sympathetic ramisection approximately six hundred times with three deaths Two of these deaths were from embolus shortly after the operation and one was from pneumonia in the first week following operation Thus the operative death rate is 0 5 per cent Approximately three hundred patients underwent operation and two operations were performed upon each patient In some instances all four limbs were deprived of their sympathetic nerve supply In the case of the upper limb it is interesting to note, a sympathetic trunk section performed bilaterally in the upper thoracic region has not apparently a detrimental effect on the cardiac mechanism Many patients were able to play vigorous games after operation without discomfort Many of the operations I performed must be regarded as experimental

To ascertain the effect of operative treatment in spastic paralysis and allied conditions, I sent a questionary to each of my patient and received one hundred and twenty-six replies and in each case it is from the patient's or parent's own opinion of the improvement that the figures are compiled My record show that the remainder of the patients that did not reply had similar if not better results The patient or parent is after all the best judge of improvement although he is not able to recognize the physiological changes following ramisection when complicated by some other condition For example one parent returned the answer "No result at all" when to my knowledge and from cinematographic records the practical and physiological result was good but was marred by the presence of bilateral talipes calcaneus which did not allow the patient to walk properly Another patient 23 years of age who walked for the first time in her life six weeks after operation returned the result 'Good with room for improvement' I think most surgeons who treat spastic paralysis would have classified the result as excellent

The following are the patients' own opinions of their improvement in answer to the question if the results could be classified as (1) excellent, (2) good, (3) poor, (4) no result at all

Congenital Spastic Paraplegia

Thirty-seven patients or parents replied as follows

Excellent	8 (21 62 per cent)
Good	20 (54 05 per cent)
Poor	5 (13 51 per cent)
No result at all	4 (10 8 per cent)

Some result was obtained in at least 88 per cent of all patients and good or excellent results were obtained in 75 6 per cent

Congenital Spastic Hemiplegia

Thirty-five patients or parents replied as follows

Excellent	11 (31 42 per cent)
Good	14 (40 per cent)
Poor	9 (25 71 per cent)
No result at all	1 (2.85 per cent)

Some result was obtained in 97 per cent and an excellent or good result was obtained in 71 4 per cent Many of these results followed my old operation of cervical ramisection On October 6th, 1929, I introduced a more complete operation, and the recent results are better

Congenital Spastic Chorea

Ten patients or parents replied as follows

Excellent	3 (30 per cent)
Good	4 (40 per cent)
Poor	3 (30 per cent)
No result at all	*nil*

In patients suffering from this disease some result was obtained in 100 per cent and an excellent or good result was obtained in 70 per cent Patients with all degrees of spastic chorea were treated from those with spasm which resembled decerebrate rigidity to those with choreiform movements preventing the patient feeding himself or standing up properly This so-called spastic chorea is not a true spastic condition as the patient is really not spastic during his quiescent period That is to say, there is no opposition in passive movement but the patient is unable to inhibit the choreiform movements

Acquired Spastic Hemiplegia

This section includes cases arising from cerebral haemorrhage embolus, gunshot wounds and trauma In most patients my old operation of cervical ramisection was performed

Excellent	4 (21 5 per cent)
Good	7 (36 8 per cent)
Poor	7 (36.8 per cent)
No result at all	1 (5.2 per cent)

Some result was obtained in 94 per cent and an excellent or good result in 58 per cent The results are very much better with thoracic sympathetic trunk section as shown by the result of a more complete operation in the following case report

Thirty-eight years previously the patient had had what was described as a heat stroke resulting in a fit This was followed by loss of function in the right upper limb She had had various forms of treatment and when she presented herself she had regained the ability to move the hand but the movement were slow and difficult She could not extend her fingers with the wrist dorsiflexed nor could she supinate the hand or extend her arm above her head She had some control of the intrinsic muscles but she could not place her thumb on the little finger The reflexes were hyperexcitable and the relaxation time was prolonged There was resistance to passive movements of the right upper limb in all directions

Right sympathetic thoracic trunk section was performed on April 2nd, 1930 This was followed by an immediate loss of tone and relief of her spastic condition She regained the movement of dorsiflexion of the wrist and supination of the forearm within a few days The patient was able to shake hands this was the first time she had used her hand in this way for thirty-eight years She could put her thumb on her little finger with ease and the control of her intrinsic muscles was very much improved

Acquired Spastic Paraplegia

The patients in this group include those suffering from disseminated or lateral sclerosis

Excellent	2 (50 per cent)
Good	2 (50 per cent)
Poor	*nil*
No result at all	*nil*

Excellent or good results were obtained in 100 per cent, but the numbers are too small to be reliable From my records I know that other patients did not obtain satisfactory results, but I performed many experimental operations in practically hopeless conditions In lateral sclerosis there is no hope of obtaining results if the cerebro-spinal pathways are sclerosed and incapable of transmitting motor impulses

Parkinsonian Rigidity

Twenty-two patients replied as follows

Excellent	1 (4.5 per cent)
Good	5 (22.7 per cent)
Poor	9 (40 76 per cent)
No result at all	7 (31 7 per cent)

Some result was obtained in 68 per cent of these patients and an excellent or good result in 27 per cent The large returns for "poor" or "no result at all" are due to the effects of the progressive sclerosis which is associated with this disease There are changes in reflex activity and in movement after ramisection, and these remain, but the patient gradually loses initiative and it is this mental change which modifies the practical result The tremor of paralysis agitans is modified only but not removed, by ramisection

Chronic Constipation and Megalocolon in Adults

	Chronic Constipation	Megalocolon
Excellent	1 (50%)	2 (66%)
Good	1 (50%)	1 (33%)
Poor	*nil*	*nil*
No result at all	*nil*	*nil*

An excellent or good result was obtained in 100 per cent in each class of disease

The operative treatment of chronic constipation and Hirschsprung's disease followed my observations made in patients suffering from spastic paralysis These spastic patients are commonly constipated, and the results following ramisection were so striking that Dr R B Wade applied a modified ramisection to the condition known as Hirschsprung's disease in children [2] I have operated on five adult patients—three with dilated large bowel and two with chronic constipation The following two histories indicate the condition before and after operation

CASE I

This patient, a female, aged 28, had always been constipated Four "alophen" pills would produce only a slight movement of the bowel She stated that it was usual for her to have an interval of eight days between motions She had always suffered with indigestion She complained of ill health and inability to perform her household duties

On examination her knee jerks were found to be hyperexcitable, with slow relaxation, and there were no oscillations This was more apparent on the right side than on the left, and was taken as evidence of sympathetic hyperactivity

A modified left lumbar sympathetic ramisection was performed on October 24th, 1929 On December 3rd she had very much improved, she had lost the pain in her back and the movements of her bowel were normal When seen on May 7th, 1930, she stated that she had gained a stone in weight, that she had not taken any aperients for over six months, and that she was feeling particularly well

CASE II

The patient, aged 58, complained of fatigue, slight nausea, and sleeplessness He stated that at times he had previously been constipated for ten to fourteen days On the last occasion four weeks had elapsed since he had had a normal motion These attacks had occurred about every four months for the last twenty years He had had tonsillitis as a child and malaria when 40 years of age Appendicectomy had been performed at the age of 47, and his tonsils and devitalized teeth had been removed one year later His basal metabolic rate was +22 The patient stated that he felt mentally fatigued and hazy during attacks No abnormality was discovered in the urine Radiological examination showed a dilated pelvic colon The reflexes were hyperexcitable and retarded in relaxation He had a very bad colour and perspired freely

A modified sympathetic ramisection was performed on May 6th, 1930 He was given an aperient which caused a motion on the second day Since then he has had a motion every day An interesting point is that the reflexes returned to normal after operation, and the patient has lost what he described as haziness in his mental outlook

Sarcoma of the Femur

The effect of ramisection on the lymphatic circulation is illustrated in a patient suffering from a sarcoma of the lower end of the femur

In this patient amputation of the limb was considered useless owing to the *x* ray appearances of the tumour and the duration of its growth The patient suffered extreme pain This was completely relieved by sympathetic ramisection, and there was, in addition a shrinkage of the tumour Shrinkage was so rapid that it could be due only to improvement in the lymphatic circulation Before operation the growth measured 38 cm in circumference, and on the afternoon following operation 36 5 cm Eleven days after operation it measured 34 8 cm Secondary growths in the inguinal region then appeared and involved the blood vessels, particularly the veins and lymphatics, and the growth gradually increased in size, though it did not attain the size it was before operation The patient died about three months after operation Professor Welsh of the University of Sydney reported the growth to be a fibro sarcoma

Raynaud's Disease and Buerger's Disease

Thirteen patients replied as follows

	Raynaud's Disease	Buerger's Disease.
Excellent	5 (71%)	4 (66%)
Good	2 (28%)	*nil*
Poor	*nil*	2 (33%)
No result at all	*nil*	*nil*

An excellent or good result was obtained in 100 per cent in Raynaud's disease and in 66 per cent in Buerger's disease

A constant and most obvious change that follows ramisection is vaso-dilatation This was described by me in my first paper, and the observation was used by Adson and Brown in their application of a modification of ramisection in Raynaud's disease The sympathetic supply to a lower limb may be entirely removed by dividing the laterally directed rami to the second, third, and fourth lumbar nerves, and by dividing the lumbar sympathetic trunk at the level of the fourth lumbar vertebra What is the reason, therefore, for removing part of the nerve supply of the bladder and bowel at the same time? The necessity for opening the peritoneum is also not obvious, but it is done by some surgeons as a routine procedure It is a more dangerous and shock-producing operation, and is accompanied by a higher death rate than operations by the lumbar route

I have operated in seven instances for Raynaud's disease with successful results, and in six instances upon patients with thrombo-angiitis obliterans with successful results in four

Writer's Cramp

Writer's cramp is a condition which can be treated by surgery of the sympathetic nervous system, as illustrated by the following case history

The patient complained of inability to write This was due to retraction of the hand controlling the pen When he attempted to write, the thumb and wrist flexed, and this movement was accompanied by severe pain The onset had been sudden, and had occurred seventeen years previously

A thoracic sympathetic trunk section was carried out in August, 1928, and the pain and spasm immediately disappeared At the end of six months he was able to write from two to four hours a day The character of his writing also improved In June, 1930, he wrote "I can write more freely and for long periods. The pain and spasm have completely left me"

From this result it may be expected that the condition known as "telegraphist's cramp" may be successfully treated by operation on the sympathetic nervous system

Anterior Poliomyelitis

The application of sympathetic ramisection to the paralysis left by anterior poliomyelitis leads to satisfactory results as far as the paralysis is concerned There was definite increase in power in one or two instances In one instance, in answer to the questionary, the parent of the patient classified the result as "good," stating that there was little difference in the size of the two lower limbs compared with what there had been, that her circulation had improved, and that she was walking much better There are, in my opinion, very few instances, however, in which the operation of sympathetic ramisection could be applied to anterior poliomyelitis, but there are perhaps a few in which general weakness of a limb could be improved by increasing the blood supply

Conditions Simulating Tic Douloureux

A patient, aged 9 years, complained of pain in the right side of the face for a period of two years The pain was not constant, but occurred in severe exacerbations two or three times a week, and was referred to the distribution of the trigeminal nerve During attacks the face became flushed, and the flushing was accompanied by excessive lacrymal secretion and secretion from the right side of the nose Eating often precipitated a spasm, but at other times it came on from no obvious cause He also complained of pain in the lower end of the spine when the pain in the face was present The pain was agonizing and made the patient cry After the pain had passed off the patient felt cold, and passed quantities of light-coloured urine

On examination the face was a little more sensitive on the right side X ray examination of skull pelvis and jaw showed no evidence of any pathological change, and the patient's serum did not react to the Wassermann test

Thoracic sympathetic trunk section was performed on February 13th, 1930, and this was followed by attacks which gradually increased in severity and number He had nine attacks in two weeks The attacks then ceased, and he has had none since The patient has now been free from pain for over six months

The diagnosis of this condition may be disputed on account of the age of the patient, but the pain was referred to the trigeminal supply The attacks did not cease immediately, this may be explained on the basis of paralysis of circulation and increased congestion following division of sympathetic nerves to one side of the head

Unusual Vaso-spastic Conditions

The following two case reports relate facts that are not usually described in medical literature

CASE I

The patient was a girl of 14 years of age who had sudden pain in her right foot two and a half years ago This was accompanied by swelling of the foot and leg The first attack lasted for three weeks and disappeared as suddenly as it came on Occasionally she had been two months at a time without symptom but she had a prolonged attack in 1929—from February to May For the last six months pain and swelling had been present every two or three days The attack prior to operation had lasted seven weeks

On examination pulsation was felt in the posterior tibial and anterior tibial arteries at the ankle The deep reflexes were hyperexcitable and prolonged in relaxation on the right side normal on the left The right lower limb was cold and there was excessive vasomotor tone as evidenced by the slow return of colour after the removal of pressure

Sympathetic ramisection of the right lower limb was performed on May 10th 1930 This was followed by an immediate cessation of pain and disappearance of swelling There has been no recurrence of her symptoms since the operation

CASE II

For about two years the patient had suffered from coldness in the left lower limb The right lower limb was also affected but not so badly This prevented the patient from sleeping at night and was accompanied by a feeling of heaviness and profuse perspiration The condition had been treated elsewhere as neuritis Exercise made the leg warmer but it became cold soon after the patient rested

Left lumbar sympathetic ramisection was performed on October 2nd 1929 This was followed by immediate relief and cessation of perspiration and coldness The right lower limb also improved as a result of operative treatment of the left side Improvement has been maintained up to the present time

RETINITIS PIGMENTOSA

The latest and a most important application in surgery of the sympathetic nervous system is in the treatment of blindness associated with retinitis pigmentosa This disease is characterized by degeneration of the retinal tissues and an accumulation of pigment in the substance of the retina consequent upon degeneration and constriction of the retinal vessels The idea that the disease is caused by degeneration of retinal vessels is supported by experimental evidence Another suggested cause is that the disease is due to a primary degeneration of nerve tissue but it is doubtful that this occurs apart from some alteration in blood supply

The subjective signs of the disease are (1) night-blindness (2) loss of visual acuity, (3) contraction of fields of vision (4) in advanced cases total blindness

My attention was first directed to the pathological changes in the blood vessels in this disease by Dr Lawrence, ophthalmic surgeon of Melbourne, and I thought that as division of the sympathetic supply of the eye would permanently dilate the vessels the conditions underlying the disease might be altered with beneficial effect Dr L A. Brearley ophthalmic surgeon of Sydney, sent me the patients and examined them after treatment

The operation I carried out upon these patients was thoracic sympathetic trunk section, and consisted in dividing the sympathetic trunk just about the level of the second thoracic ganglion This operation has been described elsewhere [3]

Results of Operation

The first patient underwent operation on May 29th 1930 During the week after operation he did not improve but since then there has been steady improvement in the acuity of vision and in the enlargement of the fields of vision The patient had had retinitis pigmentosa for the past ten years Prior to operation he could not see clearly everything was misty for example he could not see fingers moving at a distance of four feet He was totally blind in the dark He had suffered from blepharospasm of the right eye for three months prior to operation Two weeks after operation he could tell the time on a clock with a two-inch dial black figures on a white ground He could also distinguish fingers moving at a distance of four feet On June 18th he was very much improved he could read letters half an inch high and the face of an alarm clock with a four-inch dial at a distance of eight feet On June 24th he reported that the fields of vision were enlarged and that the vision of the left eye was also improved although the right thoracic sympathetic trunk only was divided in the operation He also reported that he could read small print in a good light The blepharospasm disappeared

The other four patients have also had some improvement in the acuity of vision and enlargement of the fields of vision, but it is too early to state the results accurately excepting in one instance, in which the field of vision was enlarged three times in a month

GENERAL OUTLINE OF THE PROBLEM OF TRAINING HEALTH WORKERS *

BY

J G FITZGERALD, M D, LL D,

PROFESSOR OF HYGIENE AND PREVENTIVE MEDICINE, DIRECTOR OF THE SCHOOL OF HYGIENE AND OF THE CONNAUGHT LABORATORIES UNIVERSITY OF TORONTO

THE topic assigned to me in this symposium is the General outline of the problem of training health workers Health workers include university graduates in medicine arts or science engineering agriculture public health nursing social science and those who have received training in the duties of a sanitary inspector Many of these possess a basic professional training and have also spent one or more years qualifying as public health administrators bacteriologists engineers statisticians etc

In connexion with the vocational preparation of health workers it is pertinent at the outset to consider whether universities can reasonably be expected to provide courses of study for those who wish to equip themselves for any and every type of public health work In some universities it may be quite impossible under existing financial conditions to assume any responsibility for graduate work in public health Others may content themselves with undergraduate teaching of the subject in the medical arts science and engineering faculties Still other institutions may indicate that they provide graduate instruction for those equipped and trained by suitable undergraduate study to profit by instruction of a real university graduate character The fact is that university schools of hygiene in North America are largely at the present time limiting their activities to the preparation of students who are graduates in medicine arts science or engineering Exceptions are found in Canada where a university school of hygiene has assumed a share in the responsibility for the instruction of graduate nurses (not university graduates) who are registered in one or two year certificate or diploma courses

Adequate arrangements for the conduct of graduate work in public health or preventive medicine in a university school of hygiene leading to the degree of master of arts or doctor of science or of philosophy usually presents a monetary problem only Assuming adequate appropriations and a suitably qualified staff real graduate work in epidemiology physiological hygiene infection and immunity as well as in other cognate subjects can be carried on It is hardly necessary for such graduate students to have access to health departments even though such a contact may have mutual advantages Those engaged in qualifying as specialists in public health are as a rule doing research and possibly some teaching and will probably be called upon to occupy university positions or direct the work of certain divisions in large and important health departments This portion of the student body of a university school of hygiene constitutes a very essential part of the whole public health occupational group To neglect recruiting for this unit may lead to serious difficulties in the future Public health, like

* Read in opening a discussion in the Section of Preventive Medicine at the Annual Meeting of the British Medical Association, Winnipeg 1930.

other branches of applied science, will advance only if observation and investigation indicate the solution of complex or difficult problems Some of the researches of this group will be most conveniently carried on in laboratories, others in the field or in the hospital or clinic, others in more than one of these

The preparation of the specialist in bacteriology and immunology, in physiological hygiene, in epidemiology and statistics, requires several years, also a sound scientific foundation Others with much less in the way of preparation may be qualified to do exceedingly satisfactory work of a routine character in these fields, but should not be counted upon to make novel contributions, though, of course, they may sometimes do so Several university centres in the United States and in Canada now afford facilities for the preparation of these specialists, and there is an annual increase in the number of university graduates in honours biology, physics, chemistry, and mathematics who are entering upon careers in one of the scientific branches of public health It is interesting to observe how largely such graduates bulk in the faculties of a number of the more recently established schools of hygiene

Because of the economic as well as the humanitarian significance of the work of the modern public health engineer, his training can hardly be too broad or too prolonged It is he who considers, approves, or recommends the expenditure of vast sums of money for the creation of public works which profoundly affect man's environment These engineers, then, should truly be scientists, men of affairs, as well as lovers of beauty, if we and our descendants are to enjoy the benefits of sanitation so applied that our aesthetic and physical well being is to be safeguarded In at least one or two splendid institutions of higher learning in North America provision has been made for the training of public health engineers An increase in the number of such institutions will doubtless be observed when the demand becomes insistent or the need more obvious

What of the preparation of public health nurses or health visitors? Those emissaries of preventive medicine certainly cannot be too well equipped or too carefully prepared They it is who, in the home, in the school, in the residential institution and elsewhere, interpret and spread the important truths of public health which, to be more effective, must be widely known and understood As interpreters of science they have no mean task Preventive medicine is one of the most essential of all the branches of applied science To serve mankind fully and generously, its precepts must be understood and practised In increasing the understanding of the potentialities of preventive medicine the public health nurse has a splendid field of service

The equipment which is necessary to enable these public health workers to carry out their responsibilities may be obtained in special schools of nursing or university schools of hygiene Their preparation may require one or two years' after graduation from the nurse training school of a general hospital A standard not less than university matriculation should be the requirement for entrance into those training schools from which public health nurses are to be recruited The content of the courses suitable for these students is at present the subject of interesting experiments in certain university schools of hygiene in Canada and the United States Only the technical training of sanitary inspectors can be referred to here It may be indicated, however, that their suitable preparation for the responsible posts they occupy is a matter of interest and importance to the community at large as well as to departments of public health Neither Canada nor the United States, apparently, has progressed in this matter as far as Great Britain Satisfactory provision will doubtless be made in more than one Canadian university centre in the near future Field training stations in the United States have assumed this task in a number of states where whole time health units, county or other have been instituted in large numbers

Finally before proceeding to discuss more in detail courses of study for physicians who intend to enter whole time public health work a word should be said about the desirability of recruiting well trained graduates in veterinary science or agriculture for work in this field In laboratories, in food control activities, and in general sanitation such graduates can and do perform important duties in many health departments in various communities in North America Their training is of a university grade, and important contributions to science are constantly being made by certain of them The courses of study which equip them for public health work need not be outlined here There remains for consideration the question of the preparation of graduates in medicine for public health work

The curricula of many schools of hygiene in the United States and Canada provide for one year courses leading to a diploma or certificate in public health In addition, in the United States, certain universities offer two year courses leading to a doctorate in public health or to a doctorate of science in hygiene It is true that these two latter courses are open to graduates in arts or science as well as to medical graduates In one school at least the course leading to the degree of Doctor of Public Health is open to students "who have completed satisfactorily three years of the course in an approved medical school and who have had a liberal education as evidenced by a degree in arts or science or its equivalent" In an interesting statement which recently appeared in the *American Journal of Public Health* the courses of study, chosen by members of an honorary public health society organized in the United States in 1924 and now numbering 225, were presented To quote from this statement

"The most popular degree represented among the members of the society is the doctorate of public health (Dr P H) which is held by 69 persons Twenty of the medical graduates have obtained certificates in public health (C P H) without other public health degrees, while 5 have taken the doctorate of science in hygiene (Sc D) Among the 129 non medical sanitarians, the doctorate in science has been the most popular, as there are 30 such degrees Doctors of philosophy are also numerous, 26 being listed, though mostly among faculty members Fifty seven of the 250 members are listed as holding only bachelor or master degrees, or certificates in public health Many of these are, however, candidates for various doctorates, though a considerable number are already actively engaged in public health work In tabulating the occupations of the members of the society it is significant that the largest proportion are teachers, though of course many are connected with the faculties of the institutions having chapters About 30 are with other universities State health departments claim 24, and local health work only 14, according to the available records Another 25 are associated with voluntary health agencies Only 31 of the total of 250 members are listed as being outside of the United States"

The graduate training of physicians in public health presupposes at least some undergraduate instruction in the subject Since this latter topic is to receive extended consideration in another communication to be presented later, it will be sufficient to indicate in a few words what has been and is being done in some representative medical schools in the United States and Canada

In 1924 there was established in the University of Toronto a course of practical instruction or field work for undergraduate students in medicine This was in addition to the then existing forty hours' didactic and demonstration course In general it was designed to do two things—namely, to familiarize the medical student with the opportunities which would later be open to him as a medical practitioner to practise preventive medicine, and in the second place to acquaint him with the public health resources of a modern urban community

The course was planned to occupy between three and four weeks of the time of the student, the exercises in the course each requiring one half day The number of exercises has varied from twenty eight to thirty two, and they have been given in part in the laboratories of the School of Hygiene in the University of Toronto and partly in the Departments of Public Health of the Province of Ontario and of the City of Toronto In addition, various farms where milk is produced, certain dairies, and some industrial establishments have been utilized for observational visits Without the very generous and sympathetic co operation of staffs of the health departments mentioned and the very cordial assistance of a number of private corporations and individuals, this plan of instruction could not be carried out

One other feature of the course may be referred to Students engage in the undertaking either in the spring at the close of the fifth year or in the fall just before the opening of the

sixth or final year of the medical curriculum Thus the medical undergraduate has an extended experience in public health and preventive medicine at a time when he is free from the distractions of many other courses of study This arrangement is not intended to relieve other departments of the faculty of medicine of any of their responsibilities for the so called permeation of the curriculum with the preventive idea On the contrary it is emphasized that the goal will be reached only if all departments of the medical faculty provide instruction and draw particular attention to the preventive aspects of the different subjects both laboratory and clinical primary and final

This matter has been dealt with at length because as far as the writer is aware the Medical Faculty of the University of Toronto was the first to institute such a course of study for undergraduates In my opinion this may lead in the future to a greater understanding of the work of the health departments by medical practitioners a keener realization and better understanding of how physicians may participate more freely and fully in the practice of preventive medicine and finally to an increase in the number as well as improvement in the quality of medical recruits for full time work in the field of public health

Other very desirable efforts designed to stimulate the interest of medical students in public health and preventive medicine have been introduced Examples of these are—the Harvard plan requiring undergraduates to undertake a sanitary survey and present the results in a very complete and comprehensive report the McGill arrangement whereby each student undertakes a health study of a city or town and presents a report to the department of public health and preventive medicine embodying a carefully prepared statement of the health and social welfare resources of the community studied Finally it is worth noting the interesting and valuable work required of undergraduate medical students in the Dalhousie Health Centre in connexion with Dalhousie University under Professor W H Hattie There through domiciliary visits the student is afforded an opportunity of observing environmental social and economic conditions which so profoundly influence our efforts in the practice of preventive and curative medicine

The medical undergraduate of to day in many universities in the United States and Canada is very much better equipped than was his predecessor of ten twenty or thirty years ago to proceed to his graduate work which will lead him either in the one year course to the diploma of public health in Canada or to the certificate in public health in the United States or in the two-year course to a doctorate in Public Health or the Science of Hygiene

The curricula for the diploma or certificate of public health vary in different universities The major courses in all of them however include bacteriology immunology epidemiology statistics physiological and industrial hygiene To these are usually added public health engineering chemistry nutrition parasitology administration etc In general it may be said that where a student devotes a second year to obtaining a doctor s degree he usually spends this time in advanced work in one or two branches only The balance between laboratory courses and practical work in the field varies also reflecting not only differences in the viewpoints of the faculties of the universities concerned but also the difference in opportunity for practical work and variations in the degrees of intimacy existing between teaching institutions and the public health bodies official and voluntary in their respective communities

Fixed and rigid curricula for the diploma of public health have not yet emerged in Canada or in the United States Experiments may be undertaken and changed in content or method if the results indicate that modification is desirable This is probably fortunate in countries where universities or at least some of them have concerned themselves with problems relating to the training of health workers during a period of hardly more than twenty five years The problem has been introduced in this very general way because to others has been delegated the task of specifically setting out in greater detail the ways in which medical student physician public health nurse sanitary inspector and others may be suitably equipped to carry on the satisfying tasks of promoting health preventing disease as well as increasing man s length of years

UNDERGRADUATE MEDICAL TRAINING IN PUBLIC HEALTH*

BY

A GRANT FLEMING MB DPH,

PROFESSOR OF PUBLIC HEALTH MCGILL UNIVERSITY MONTREAL.

There are three major problems in the training of the undergraduate medical student in public health The first is to provide him with at least a minimum of the factual knowledge which he will require The second is to show him the field of work and thus by the visualizing of opportunities stimulate his interest and enthusiasm to desire and acquire more knowledge The third is to bring him to understand his responsibility for applying his knowledge for the benefit of those who will look to him as their medical adviser It should be borne clearly in mind that we are training men to be general practitioners and not to be health officers

Ideally the preventive aspect of medicine should permeate the whole teaching of medicine To what extent this is possible will vary from place to place because of the personal factors involved This ideal should be a guiding principle and it should tend to limit the instruction given under public health and preventive medicine in so far as it is practicable for other departments to deal adequately with the preventive aspect of their particular subject There is no doubt that the medical student is more impressed by the teaching of his clinical instructors and to the extent that such instructors direct attention to prevention there will be found a proportionate increase in the interest of the student body

The medical student approaches the study of medicine as a subject of diagnosis and treatment to him the practice of medicine means the care of the sick Knowing this it would appear that an early contact should be made by the Department of Public Health and Preventive Medicine with the incoming student body and that this contact should be maintained throughout the entire medical course If this contact is made early it should at least be possible to convince the student that prevention forms a large part of the practice of medicine and that if he is to be properly equipped to practise his profession he must be quite as well qualified to prevent disease as he is to diagnose and treat it The approach to the student is not made with the idea that he should be less interested in diagnosis and treatment but rather that his interests should be extended to include prevention Particular emphasis may be placed on the fact that there is no sharp line between treatment and prevention and that proper early treatment is essentially preventive

In the first year the student can be shown the field of preventive medicine He can be given some idea of its possibilities as applied to the community by organized health departments and particularly regarding the opportunities in private practice He should be told how medicine is becoming socialized and how the public demand for health guidance is changing the practice of medicine in order that he may be prepared for this Early in his course the student will welcome the subject of personal hygiene because it will *enable him to talk intelligently about subjects* which are everyday topics of conversation This compensates for his ignorance of disease—a matter of embarrassment to most young students There is also an opportunity to point out some practical applications of anatomy and physiology and to give the student the viewpoint that an understanding of the normal is essential in the practice of medicine as for example in the periodic health examination

In the second year the student may be introduced to public health organization Here the approach should be through the relationship of the practitioner of medicine to the health department If medicine and particularly public health is presented as one of the social resources of mankind the student will appreciate that if he is to render proper service to his patients he must know and make use of all available community resources The history of the development of the modern public health movement is full of interest and serves as an excellent background upon which to fix the

* A paper read in the Section of Preventive Medicine at the Annual Meeting of the British Medical Association, Winnipeg 1930.

student's attention and to give him an understanding of the present public health organization This may be rounded out with advantage by some instruction covering the social resources outside public health which the practitioner commonly uses or which he should use for the advantage of his patients The Department of Public Health and Preventive Medicine is responsible for the teaching of public health organization as such, and the medical student should be shown clearly where he, as a general practitioner, will fit into organized public health work, and his legal and moral obligations in this connexion should not be overlooked in his instruction

In the major course which is given by the department, we must consider what subjects are to be covered and what time should be allocated to each The subjects which appear to be of major importance are the various hygienes and the communicable diseases It is not minimizing the importance of sanitation to say that for the medical practitioner, it is less interesting than the hygienes and the communicable diseases The sanitation about which he needs to know is chiefly rural sanitation, for in cities and towns sanitation is the responsibility of the public authority, whereas, in many rural areas, the public authority is practically non existent, and the practitioner must be prepared to give sound advice

No hard and fast rule is recommended in the allotment of teaching hours for the various subjects, because it is advisable to keep in mind the varying capacity of the teachers If one teacher is particularly experienced, then it is wise to give him additional time for his subjects, and to use the more thorough teaching on such subjects as a basis for other teaching If for example, industrial hygiene is stressed, then the teaching of ventilation, of lighting, and of health examination in industry can be used as the basis for such teaching when dealing with school hygiene, and the time devoted to school hygiene can be proportionately reduced

Mental hygiene is part of preventive medicine The more closely the mental and physical health problems are kept together, the better the student will come to understand that when dealing with any individual from infancy to adult life, he must consider the whole individual, mentally as well as physically It is not a question whether physical or mental health is the more important, it is rather a question of understanding that every individual has a physical and a mental side, and that health can only be attained through a proper development of both, also, that the prevention of physical and mental diseases must be considered on the same basis

Communicable disease prevention and control are better dealt with after the student has acquired some clinical knowledge of the communicable diseases, and therefore the proper time for dealing with them depends upon when the clinical instruction is given The communicable diseases and other infections are an important part of the practice of medicine and so the community control and individual measures of protection should be covered in some detail Instead of fearing overlapping or duplication in important subjects there should rather be concern lest essentials be omitted

In order to make the subject something more than theory, in order to have the student know that the material which he is being taught is actually applied, it is desirable that he should see as much public health work in operation as is practicable Field visits must be made worth while, or they are a waste of time and minimize the importance of the subject under consideration

With these points in mind we have devised a course at McGill University which I shall outline briefly, not because we consider it ideal—for we do not—but because it is an application of what I have said The organization and development of our course has been made possible by the whole hearted and sympathetic support of the Dean of the Faculty of Medicine Dr C F Martin, and the co operation of the other departments, acknowledgement of which is gratefully made

The course in medicine at McGill University is one of five years In the first year the Department of Public Health and Preventive Medicine has a course of six lectures which serve as a contact with the students, introducing them to the subject of public health and preventive medicine with special reference to personal hygiene In the second year ten lectures are given on public health organization and administration, including community social organization

The major course of thirty five lectures is given in the third year Ten of these lectures are on mental hygiene, six on industrial hygiene, and eight on the other hygienes Eight half days are available for field visits Of these, two are taken in the laboratory to demonstrate public health bacteriology As we have found the class room demonstration to be of great value, through the co operation of two voluntary health agencies, we have had such demonstrations covering the visiting nurse's visit to the home and a child welfare conference It is our intention to have more of these demonstrations There is a written and an oral examination at the end of the third year

As communicable diseases are a fourth year subject, we give ten lectures in that year on the preventive aspect of communicable diseases

The student is required to make a health study of some area, and to present his report during the first month of his final year The purpose of this study is to have each student visit some centre and see public work health in operation, thus causing him to do some thinking about public health and preventive medicine In the report of his study, he records the facts as he finds them, discusses them, and makes criticisms and recommendations The report is reviewed with him individually by one of the staff, and we have found the hour devoted to this review to be most profitable In the final examination 25 per cent of the marks are given for this study, public health and preventive medicine being one of the final subjects

The fifth year is a clinical year, and we plan to offer as an option, to a limited number of students, the opportunity for special work in child welfare, mental hygiene, and industrial hygiene as part of their fifth year work

This is a brief statement of the ways in which we have a contact with the student throughout his course, and an expression of what we consider to be the principles of undergraduate medical instruction in public health and how we are applying these principles at McGill University

SPECIAL OR POST-GRADUATE PUBLIC HEALTH TRAINING *

BY

DONALD T FRASER, *M C*, M B, D P H,

ASSOCIATE PROFESSOR OF HYGIENE, UNIVERSITY OF TORONTO

Dr Fitzgerald, in his opening paper, has surveyed the problem of the training of health workers It is my duty to present in more definite terms how certain phases of the problem are being met, and indicate the new developments in training that might logically be initiated

Let me deal first of all with the group of out and-out specialists who have come to the university and enrolled in its school of graduate studies I refer to those whose academic qualifications have been acquired in some branch of learning other than medicine, who are proceeding to a degree of master of arts or doctor of philosophy, and who have elected to specialize in some subject closely related to public health under the guidance and responsibility of departments of hygiene and preventive medicine Every effort should be made to give such students the best, soundest, and most adequate training that a university can offer, for it is from this group that most teachers and research workers will be recruited It would not be profitable, nor would it be expedient, to enter into details where such a diversity of subject-matter is involved

There is another aspect, however of this training of the specialist group It would seem that there is a definite need to include in the scheme of education of the health worker a university course designed especially for the person who wishes to become an expert technical assistant

* A paper read in the Section of Preventive Medicine at the Annual Meeting of the British Medical Association, Winnipeg, 1930

It may be suggested that provision has already been made inasmuch as schools of hygiene provide post graduate instruction for such students and that an adequate cultural background is ensured by the bachelor of arts degree Would it not be a great economy however, to provide a definite course leading to the degree of bachelor of arts, but at the same time qualifying the student for a special vocation in which after four years of study he might obtain a position with at least some remuneration? Universities have already established a precedent of long standing in vocational training not only in offering such courses as engineering and dentistry but music and commerce The need for such specialists is acute One thinks of special training for biometries and biomathematics for bacteriology and serology for physiological and industrial hygiene Obviously the existing departments of a university would be called upon to provide the desired instruction

The public health nurse has assumed a very important role in all schemes of municipal and rural public health It is generally conceded that she has accomplished in large measure what far-seeing health administrators expected of her It is time however, to ask if the courses of study are adequate to train her for the work she is expected to do Her first duty is undoubtedly that of an educator—to preach the *gospel of public health and* preventive medicine She is often called upon to teach health habits in the schoolroom she has become the technical assistant to the school doctor, every day she has to deal with economic and social problems which are often of paramount importance Apart from exceptional circumstances she does no bedside nursing Primarily she is a teacher and social case worker Is her training suited to the work she is attempting? Laying aside the question whether a nurse's training is the best training for the work of the so-called public health nurse in what way may her instruction be modified or amplified?

In Canada there are six universities where either a diploma or certificate or other degree in nursing is offered and where provision is made for the training of nurses In two of these at least—namely, in Western University and in the University of British Columbia—an elective course in public health nursing is available after two years' instruction in the university followed by two years in a hospital school for nurses The Department of Public Health Nursing in the School of Hygiene at Toronto has made a unique contribution to the training of nurses in public health by offering a four year course having special regard to public health One year is devoted to the study of the basic sciences—biology, etc , twenty-six months are spent in an approved hospital school for nursing where a course of training is laid down which when completed will qualify the candidate for registration in her profession in the province of Ontario In addition—and thereby differing from the regular nursing school requirements—definite provision is made for special training in acute communicable disease tuberculosis, and in the nursing and care of the child In the fourth or final year the candidate again receives instruction and special training at the School of Hygiene No university degree is offered other than the diploma The purpose, then of this course is to ensure a broader education by making use of the facilities offered by other departments of the university The candidate must be accepted by a recognized nursing school before enrolment in the course, and have passed the complete junior matriculation which qualifies for entrance into the university and, in addition, the senior matriculation in three subjects Thus a reasonably difficult entrance requirement is maintained which ensures the selection of candidates who are capable of appreciating the course of study pursued

One must be able to meet the accusation of the critics that perhaps we are turning out super-doctors or at least sub-doctors Nothing could be further from the minds of those who are responsible for the subject-matter in the course Take for example the study of bacteriology which is an item of the curriculum It is improbable that the individual nurse will ever look down a microscope again Nevertheless, it would be lack of imagination to deprive the student of the opportunity to learn by herself at first hand and under proper controlled conditions the fundamental facts regarding the spread of micro-organisms, their growth and cultivation, the specific toxins they may produce and how their effects may be specifically counteracted An accurate knowledge only will enable the nurse to teach in the home by precept and principle, and with conviction, the facts of infection and immunity Similarly one may uphold the inclusion of psychology and mental hygiene in the curriculum Not that the public health nurse will herself attempt to diagnose mental abnormalities, but rather that she may set in motion at the proper time and under the proper conditions the machinery available in a community with a modern health service to cope in adequate fashion with the situation as she finds it further, that she will have some real appreciation of the results that may reasonably be expected

Changes in the training of the public health nurse may be rationally anticipated to develop along the following lines (1) Insistence upon adequate educational qualifications with university matriculation as a reasonable minimum (2) Instruction for a period of one year at least in scientific subjects, with special emphasis upon biology and physiology (3) Instruction in nursing of a special character with hospital routine and nursing care reduced *to a minimum* (4) A course of instruction and practical work embodying the principles of preventive medicine and their application as well as social case work— such instruction to follow upon the nursing training and to extend over a period of at least twelve months (5) The total period of training to be not less than four years

There is little purpose in attempting to formulate a fixed curriculum of instruction universally adaptable for graduates in medicine who are qualifying for a degree in public health, since countries differ too widely in customs practices, and laws to make any semblance of uniformity either practicable or even desirable Moreover the distribution of population and its racial origin modify the problems of preventive medicine and public health Provision of medical service of any character, curative or preventive for the farming districts of the Canadian West and for the northern portion of Quebec is made with difficulty—hospital health centres have been evolved to meet the conditions in one area and fully trained district officers in the other The curriculum of instruction in a new country must be elastic instructors must adopt the experimental method and modify their teaching to changing conditions This does not imply in the least that the curriculum should be in a state of constant upheaval but rather that the emphasis upon certain subjects should be shifted in order that the instruction may be best suited to the changing needs of the student A candidate for the diploma shall be a fully qualified graduate of medicine from a recognized school he shall preferably but not necessarily have spent at least one year in clinical or hospital training or in some medical institution closely allied to public health, such as a fever hospital or a diagnostic laboratory The course of study shall be not less than three semesters (approximately eight months) of university instruction and two months practical work in some branch of public health This affords an opportunity for the candidate to become more familiar with the field or work of his choice Laboratory courses in the following subjects are essential bacteriology and immunology parasitology, public health chemistry, epidemiology physiological hygiene The prescribed course in bacteriology and immunology in the School of Hygiene of the University of Toronto consists of 250 hours of laboratory work, of which 180 hours are devoted to bacteriology The exercises in bacteriology and immunology and serology are confined principally to the carrying out of the procedures of a modern diagnostic laboratory with the addition of the preparation of media by the student and the isolation and identification of micro-organisms of diphtheria pneumonia, tuberculosis, typhoid, etc A few of the best students will profit by such a course to a degree which will enable them to take charge of a public health laboratory with little or no additional technical training The average student will definitely not profit to this

extent The subjects of immunology and serology are presented by a series of practical studies and in classes where the student is himself responsible both for a theoretical discussion and for a working demonstration Parasitology is of relatively minor importance in Canada A laboratory course of 30 hours is offered A laboratory course in public health chemistry of 60 hours is designed to familiarize the student with the chemical methods for the examination of milk water, and sewage, and the principles of water purification and sewage treatment Lecture and laboratory courses in epidemiology and vital statistics comprise 220 hours lectures and demonstrations in physiological and industrial hygiene, 65 hours The time allotted for field work, including attendance at clinics, is 250 hours, sanitation, 30 hours, history of preventive medicine, 10 hours, public health administration and nutrition and dietetics, 42 and 30 hours respectively

The emphasis upon the subjects taught has shifted in a striking manner during recent years in Canada The time allotted to the study of environmental factors or sanitation has become less, while the personal factors of preventive medicine has received greater emphasis The emphasis has thus shifted from the study of the influence of the environment to that of the factors concerned in the physiology of the individual—from sanitation to preventive medicine and physiological hygiene This change has been brought about partly because of the appreciation of the achievements of sanitary engineering and partly because of the success resulting from the application of the knowledge acquired through researches in the fields of infection and immunity, epidemiology, physiology, and nutrition

TRAINING OF THE SANITARY INSPECTOR*

BY

JAMES RUSSELL ROBERTS, M.D.,

MEDICAL OFFICER OF HEALTH, HAMILTON, ONTARIO

THE great advances in preventive medicine during the last twenty years in Canada have been brought about largely because of the efforts of those having direction of public health activities, federal, provincial, and municipal, in keeping themselves abreast of new developments in the field of sanitation and hygiene

A quarter of a century ago none of the medical schools in Canada specified in its curriculum a special training in the branches of sanitary science having to do with the promotion and protection of health to enable a prospective graduate in whatever community he settled, to utilize his accumulated knowledge and skill to the best advantage of himself and those around him The care of the public health in those centres where the statute requiring the appointment of a health officer was not disregarded entirely was not infrequently entrusted to a recent graduate who needed the appointment and the stipendiary pittance attached, as a stepping stone to something higher, or in other cases to some older member of the medical fraternity whom fate or destiny had doomed to failure in the practice of his profession

In only two decades momentous changes have taken place, both in public opinion and in the attitude of the doctor himself towards the prevention of disease To-day it is being recognized by progressive physicians and by most progressive units of popular government, but particularly where people are congregated in large cities and towns, that prevention is by far the most reasonable, feasible, and most economic method in dealing with disease,' also—and this is of great importance for the future—that the State is responsible for the physical and mental health of its citizens in as full a measure as it is for their education

What sanitary science has accomplished in dealing with the great fatal diseases of former days such as small-pox, malaria yellow fever, puerperal fever, typhoid and typhus fever, diphtheria, and tuberculosis, may be ascertained by every reader of the daily newspaper and the popular magazine throughout the land It is not improbable that the life and work of such men as Jenner, Pasteur and Lister of Trudeau and Koch, of Walter Reed and Gorgas and Manson, will, in the not distant future, become the literature of the boy at the public school

Already the great wave of publicity which is being given to the spectacular accomplishments in the field of prevention, not to speak of the ever increasing new and astonishing experiments in the field of research, has developed a critical judgement in the public mind which demands capability and efficiency in those selected for the direction of public health administration No longer in our larger cities are the part time, poorly paid, haphazard services of the private practitioner considered adequate or effective for this task Experts in the solution of our social and economic problems, as viewed from the standpoint of health, are required for the duties involved

Our medical schools have not been unheedful of the situation which has confronted them Not only in Great Britain, but in this country as well, these schools have provided courses both in the principles and in the practice of preventive medicine which afford to the student a working knowledge of hygiene and sanitary science sufficient to warrant him in the assumption of the duties which pertain to the office of part time health officer in the towns and rural communities to which most of our young physicians tend to move, and which may also serve as an introduction to the training for the diploma in public health, should he subsequently decide to devote himself to one or other of the many health specialties which present opportunities in increasing numbers every year to those who are qualified to accept them

The evolution, or rather radical reform, which has taken place in our conceptions of the education and standards of training necessary to increase the effectiveness of the medical officer of health has been equally discernible in all the professional services subsidiary to his work The more progressive the health department the more insistent is the demand for the trained specialist who shall devote his time and energy to some particular phase of public health protection Epidemiologists, laboratory workers, school medical officers, directors of maternal hygiene, child hygiene, and infant hygiene, dentists, psychologists, psychiatrists, and public health nurses, cannot hope to meet successfully the problems which every enlightened health official has to face, unless and until, added to an initial capacity plus a good preliminary education, they are armed with a technical training sufficiently broad and exacting in its requirements to enable them to meet their own responsibilities in special lines, and, at the same time, to co-ordinate, where necessary, their activities with those of other official or voluntary agencies

With respect to the education and preliminary training of the sanitary inspector in Canada we must admit that the state of affairs which I have sketched perhaps too optimistically as existing in the more technical branches of the public health programme does not everywhere apply, being in many sections of the country neither satisfactory at the present time nor promising hope for the immediate future In the Western Provinces, local boards of examiners have been appointed to conduct the examinations of the Royal Sanitary Institute, and courses of lectures and demonstrations are periodically provided where a sufficient number of students register In this way the local Departments of Health in the larger centres of these extensive areas have been able to secure competent persons to take charge of municipal sanitation, including food inspection There are far too many instances however, throughout the Dominion where the sanitary inspector is the Cinderella of the health department, dreaming among the ashes of the past Too often we find him bound like Sisyphus of old to the perfunctory performance of his meaningless and unproductive task and prevented by the limitations of his education and training from becoming the integral factor that he ought to be in the machinery of disease prevention In many villages, towns, and townships, he may, in addition to his regular duties, be

* A paper read in the Section of Preventive Medicine at the Annual Meeting of the British Medical Association Winnipeg 1930

constable, assessor, tax collector, relief officer, truancy officer or dog catcher, one or more or a plurality of all combined receiving in most instances a salary not in excess of $900 or roughly speaking £200 per annum. There is no doubt in the minds of those familiar with conditions in many localities that a radical change is needed in that particular health service upon which the public traditionally places great reliance.

It is not my purpose to venture upon an appraisal of the sanitary inspector's work in comparison with that of other branches of community health service. On the one hand we find those who look upon the abatement of common nuisances, plumbing inspection and the allied efforts of the sanitary inspector as having no connexion whatever with public health and as having a tendency to obscure and depreciate in the minds of the general public the real and invaluable work that is carried on by the health authorities. These duties they submit should be transferred to other departments where they more properly belong. Others, including we think a majority of the heads of municipal health departments, take the ground that proposals of this kind are radical and unwarranted by the experience of the past and that the removal of the sanitary inspector from the jurisdiction of the medical officer of health would deprive him of an official who notwithstanding his shortcomings has been his chief dependence during the pioneer years of the struggle to obtain better conditions of health.

All participants in the argument concerning the importance of sanitation and food control are agreed on the tremendous significance of excremental filth as a cause of disease. All admit the role played by human parasites and by insect and animal carriers in the transmission of typhoid, malaria and bubonic plague. To the contention that the construction of sewers and sanitary privies for the proper disposal of sewage and the installation of pure water supplies have been potent factors in the banishment of typhoid, cholera and dysentery there are no dissenters. Outbreaks of typhoid fever, scarlet fever and septic sore throat that have had their origin in infected milk—amounting to hundreds in the aggregate—leave no room to cavil at the necessity for the strictest supervision of this food commodity. The frequency of small local outbreaks of typhoid fever in towns and villages where pasteurization is not in vogue illustrates this clearly, while the magnitude of the disaster which happened in the city of Montreal only three years ago demonstrated with terrible consequences that eternal vigilance is the price of safety. According to a report of the United States Public Health Service 4,755 cases of typhoid fever with 493 deaths occurred during the period March 1st to June 28th. It is evident, says the report, that Montreal has suffered a severe epidemic of typhoid fever with a case incidence in proportion to population probably unprecedented by any other large city within the present century. Let those who would deny to the efficient sanitary inspector a place in the sun derive what satisfaction they can from the facts of this calamity.

That there is little relation between housing and health or that the effect of insanitary conditions in home and school, workshop and factory, has been exaggerated, who will dare to dogmatize? These assertions and those of similar portent can be corroborated or proved false only by future investigation and research such as is being carried on in many fields and by scores of students with the finest intellects. Only by an extension of our inspection service, not a limitation, can the inspector hope to be of assistance in the solution of these worth while problems concerning the relation between overcrowding, bad housing, fatigue, poor ventilation, underfeeding, etc., on the one hand and the existence of disease on the other.

The kind of inspection I have in mind can only be carried out by technical experts and the thesis that I would maintain in this paper is that the sanitary inspector of the future must be more of a technical expert than he has hitherto aimed to be. Some one has said that real health work is 90 per cent. education and the remark has become current phraseology. It is only the amateur health official who seeks to get results by a display of his badge and a show of authority. The present age is one of conviction by persuasion not by compulsion. It cannot be too frequently emphasized that the individual who looks upon his position as one to be prized because of steady employment, moderate hours of work and fairly good pay, and who lacks the incentive to read and study, cannot hope to become an asset to a health department. Thus is also the age of popular instruction and the sanitary inspector must beware lest he find himself less well informed in sanitary matters than many a skilled artisan with whom his duties bring him into contact in the home. To become a good teacher he must not only have a full acquaintance with the details of his own subject but also extensive information and reading in allied and cognate subjects. He must have the ability to speak forcibly and think clearly. These are qualifications that some inherit, others gain by experience, but the capacity to think and speak and write can be cultivated by study and practice. Space does not permit in a paper of ten or fifteen minutes the discussion in detail of a suitable curriculum which might be drawn up to meet the needs of the present situation. It would however include the following among other subjects:

1. Knowledge of legal machinery, Federal, State and Municipal, for controlling disease, and of the Provincial Public Health Acts and Regulations enumerating the duties of sanitary inspectors.
2. Elementary vital statistics, the stock taking of Public Health.
3. The communicable diseases, their modes of spread and the means of prevention, the part played by carriers. Information of a practical nature on the use of vaccines, serums, antitoxins and other such biochemical agents.
4. Water supplies and the disposal of sewage.
5. Milk supplies in relation to disease, the sanitary collection of milk samples, elementary bacteriology of milk and an intimate knowledge of the machinery of pasteurization.
6. Food supplies. Elementary chemistry. The diseases of animals. Meat inspection, including the post mortem appearances of healthy and diseased animals. Cold storage. The relation of oysters and other shell fish to infection. The preparation, packing and canning of foods.
7. Personal hygiene including instruction on proper food, bathing, exercise, work and sleep, sex hygiene, the abuse of alcohol, dental hygiene.
8. The principles of good ventilation, plumbing, the sanitation of schools, hospitals and public institutions, housing conditions.
9. Inspection of restaurants, bake shops and other food establishments such as dairies and markets where food is kept or offered for sale.
10. Public Health and publicity.
11. An outline of tropical medicine.
12. Disinfection.
13. Smoke prevention.
14. Nuisances.

How shall the training in the lecture room, the laboratory and in the field which I have outlined as the minimum requirement be provided? My answer is that the necessary departments for the education of such an indispensable public health official as the sanitary inspector might become should be created in connexion with our provincial universities and that for the practical instruction and field work of a curriculum similar to that outlined these should co-operate with our various provincial and municipal health departments and perhaps in some cases with our volunteer public health and social agencies. Such a plan as this is neither visionary, nebulous nor impractical and would result, I feel confident, in materially raising the status of the inspector and in obtaining for him a corresponding increase in remuneration. The scheme of establishing boards for conducting the examinations of the Royal Sanitary Institute which has been tried in the West has produced favourable results and the syllabus of subjects and courses of demonstrations if adapted to the needs of a sparsely settled country like ours are admirable, but the scheme has not become sufficiently nation-wide, it does not evidently appeal to the young man seeking to equip himself for his life work as would a university connexion even if only part time, and it will not enlist the aid of social agencies and workers

in breaking down political opposition as would the plan to which I have merely alluded

On March 3rd of this year Mr H E Spencer, Member of Parliament for Battle River, Alberta, moved the following resolution which was adopted unanimously by the House of Commons

"That, in the opinion of this House, the Government should take into consideration the advisability of making grants to the provinces equal to one third the cost of establishment, and to cover permanently such full time health units as may be organized"

In the discussion of this resolution Mr Spencer said

"The minimum staff necessary for one of these health units will be a medical officer, a public health nurse, a sanitary inspector, and a secretary The area covered by each health unit comprises usually about six municipal units, serving a territory of 2,000 square miles, which would comprise a population of some 2,200 to 2,500 people That, of course, would vary according to the particular province in which these health units might be organized and the density of population in the area concerned"

In the event of a county or combined area unit modified by the various provinces to meet their individual requirements, being adopted—and since it has passed beyond the experimental stage in proving its effectiveness, it will become adopted, for it would appear that should the official health authorities neglect to take the leadership in the movement for the establishment of these, the people, through such bodies as the United Farm Women of Alberta will themselves assume the leadership—success or failure will depend eventually upon the qualifications and training of those in charge of the important work these units will undoubtedly perform Is it too much to expect that in this undertaking of the near future, and indeed in all efforts for the safeguarding of the public health, the sanitary inspector should be equipped with good mental endowment, sound education and proper training, so as to perform intelligently and well the tasks assigned to him? For in the final analysis progress in sanitation depends on scientific investigation, and at the same time the usefulness of new discoveries depends very much on the skill of those who have to employ them"

THE TRAINING OF THE HEALTH VISITOR *

BY

F C MIDDLETON, M D, D P H,

DEPUTY MINISTER OF HEALTH SASKATCHEWAN

In attempting to prepare a short article on the subject which has been assigned to me— The Training of the Health Visitor —my interpretation of what constitutes a "health visitor" may not exactly correspond with the interpretation accepted for instance in Great Britain

On this side of the Atlantic, our nomenclature for similar officials in the motherland differs somewhat, and, in fact, in Canada or the United States the term 'health visitor" is not generally or officially used What I have to say, therefore will refer more particularly to agencies in this country which include in their programme various forms of health visiting in its broadest sense, and I trust that in the discussions to follow we may be privileged to learn about the training and work of the 'health visitor' from those who are familiar with the duties pertaining to this office

There does not appear to be any definite standard required for those who may wish to become health visitors in America There is of course the common requirement that the person must be a graduate nurse but many training schools have a fairly low educational standard for admission, although this standard is gradually being raised Inasmuch as the product of the training school must be accepted the preliminary educational background, which is so flexible a requirement, should first be given consideration

The work of a health visitor in a very large degree is that of teaching health to do this to the best advantage, her education, before entering her nursing course, should at least be equivalent to that of a girl entering the teaching profession She is all the better fitted if she has taken her teacher's certificate, and has spent a year or more as a teacher, since much of her work will be directly or indirectly concerned with children This is especially so if the health visiting is done as part of a generalized public health nursing service, including school inspection

Her training course should be taken in an approved hospital which has a fairly high standard The hospital should have bed service for surgical and medical cases, admitting children to both services, it should also maintain an obstetrical department or be affiliated with a hospital maintaining such a service The course of study should include class room instruction in anatomy, physiology, materia medica, ethics of nursing, bandaging and fracture dressing, surgical technique, infant feeding, maternity nursing (including pre natal and infant care), and communicable diseases Before taking any post graduate work she should spend a year in private and institutional staff duty, as by so doing she will get much more out of her post graduate course in public health nursing A candidate for post graduate study in public health nursing should not be younger than 22 years, and not more than 40 years of age It will not always be possible for the candidate to comply with the preliminary educational standards mentioned above, in which case it might be necessary to set her an essay to write on a given subject to show her proficiency in expressing ideas, and to indicate the general character of her education

Her public health training must fit her to take her place in the scheme of organized public health endeavour She is to be the connecting link between the health official and the citizen She must be trained to interpret to individuals the principles of right living, and strive to create a public health conscience, which will elevate standards of living in the community She must be taught to seek personal contact with families in order to instil into them the essentials of health, before disease develops, always working forward to the prevention of disease Through her public health teaching she must be taught how to make contacts for subsequent public health teaching, by working backward from sickness in the home, or physical defect in the school Combined with the regular lectures some students will require the maximum of individual coaching and tuition

Public health nursing originated from spontaneous good will and an altruistic spirit, and these characteristics are still necessary, in a degree, in the health visitor As modern science has transformed the art of medicine, so has it transformed public health nursing in its various forms The system has developed slowly and naturally The early district nurses were required to be 'educated gentlewomen" Every nurse is not fitted to do public health work She must be tactful, she must possess a cheerful personality, she must be tenacious and have a broad vision, resourceful with plenty of common sense She must go about her work with confidence in order to gain and retain the confidence of those she visits

The functions of the public health nurse which should determine her training are to teach habits of healthful living in the home, to see to it that the physician's instructions are intelligently carried out, and to be on the alert for all that is suspicious or divergent from health These functions differentiate the health visitor from the social worker, the vocational worker, the dietitian, etc, who also share in public health work

In health visiting the emphasis swings from bedside nursing in its narrow sense to family health work with education as the basis, it has grown from including only the sick poor to an ever increasing group of independent self supporting members of society, who are in a position to pay for such service It is important, therefore, that the health visitor should obtain through her public health nursing agency her ideals and technique of health teaching, community relations, and a concept of the family as a unit for care rather than the individual sick person alone

In addition to health teaching she must also be able to give instruction through demonstrations to the family or friends regarding the home nursing of those who are ill She must be trained to be observant in order to detect

* A paper read in the Section of Preventive Medicine at the Annual Meeting of the British Medical Association Winnipeg 1930

serious problems other than sickness in the home and also to take advantage of all available resources in the community for handling and treating these difficulties. There must be a proper balance between insight into different social situations and an understanding of how to care for them when to refer them to other agencies and to which agency they should be referred. She must understand the importance of a proper contact and that this must be made with sympathy courtesy and adaptability to all individuals and situations.

The visit should reflect the general policy of the organization the health visitor may be representing. The same results cannot be expected in every community. The same not the same resources to offer. The criterion of the effectiveness of an agency other things being equal is whether it is doing the thing that is essential and that counts in that community. Generalized public health nursing will usually lend itself best to mutual contact but of course a well-organized specialized service ignores none of the health needs of the individual or family. It is usually considered more satisfactory to limit the number of agencies calling on a family as some people resent duplication. Discretion is needed in such cases. One advantage resulting from a generalized service is the human relationship that comes from the one nurse contact in the home this also stimulates the nurse to endeavour to correlate her work there. Of course special nursing may be necessary to demonstrate new types of nursing for the education of the community. Good judgement is necessary in all these cases.

Tendencies in modern nursing education indicate the need for appreciation on the part of student nurses of the preventive as well as of the curative aspects of disease. Those in charge of training schools are finding it necessary to concern themselves with the social phases of illness and with health teaching as well as with instruction in nursing technique. This is as it should be the amount of preventive teaching and public health nursing which is included in the regular course depends very largely on the available facilities.

The courses of instruction for the public health nurse in the various universities does not appear to vary a great deal the aim in all being to prepare nurses for a generalized public health nursing service or for executive and teaching positions in all fields of public health nursing. Even in a public health nursing course certain phases are being stressed more as the need is being demonstrated, such as nutrition home economics mental hygiene the relation of voluntary organizations to public health and the value of periodic medical examination. In the rural districts the generalized public health nursing system is most suitable because it is less expensive while in the larger urban centres possibly the specialized public health nursing gains favour. In the generalized system the main purpose is usually health teaching and only emergency or first-aid assistance is given.

The organization which includes hourly bedside care as its main work is the Victorian Order of Nurses for Canada this organization corresponds to the Plunkett Society of New Zealand the Victorian Bush Nursing Association of Australia and the Visiting Nursing Association of the United States.

The plan adopted by the Victorian Order for preparing nurses for staff work may be of interest. When possible it secures the services of nurses who have taken the university course in public health nursing especially for executive positions. The number of nurses with this preparation is inadequate and in order to ensure that a certain number will be available each year who have this training a limited number of Victorian Order scholarships (last year eight were granted) are granted to nurses who have had good preliminary preparation and who show evidence of executive ability. The value of each scholarship is $400 and the course given only to graduate nurses. The universities to be taken at McGill University Montreal University of Montreal Montreal University of Toronto Toronto Western Ontario University London Ontario or the University of British Columbia at Vancouver. On successful completion of the course, nurses accepting scholarships are expected to remain in the service of the Victorian Order at prevailing salaries for at least one year.

To meet the problem of securing nurses for the Order with sufficient preparation for staff work three months training is given at the Montreal branch at intervals during the year. Each student spends one week with the Montreal Child Welfare Association to which the Order pays $20 per week. It also pays the salaries of these nurses for two weeks of their training the Montreal Victorian Order paying the salaries for the remainder of the time. There is an educational director at the branch for lectures given by physicians from the medical school payment is made at the university rate. For the first week which is devoted to lectures demonstrations and observation visits no salary is paid to the nurse. If she then decides not to continue the course, or if the supervisor decides she is not adapted for visiting nursing work the arrangement may be terminated. After the first week a salary is paid at the rate of $85 for the first month to cover the nurse's living expenses and for the second and third months at the rate of $100 per month. When she has finished the training she is expected to remain with the Victorian Order for at least six months at a salary of not less than $115 per month.

The course itself is given at a teaching centre where there are a well trained teaching staff and good supervised practice at a university centre. The subjects stressed are organization technique of visiting nursing health nutrition the prevention of disease demonstrations are given especially in maternity work and child welfare work pre natal care mothers classes records and immunization. Students also receive instruction by doing visiting nursing for the Metropolitan Life Insurance policy holders this service works in very conveniently with their regular work.

The International Health Division of the Rockefeller Foundation of New York has contributed in no small degree towards enabling nurses financially and in other respects to take special courses and carry out observation work as preparation for any special department of public health activity. This Foundation with the information at its disposal can send nurses to the most suitable places for obtaining the necessary training for their particular requirements. A splendid programme and itinerary for nurses lasting three months or so is arranged at the expense of the Foundation on the recommendation of public health administration officials.

Many of the industrial and commercial firms employ nurses as health visitors those who have had post graduate courses in public health are preferred.

Some training schools for nurses are affiliated with a tuberculosis sanatorium. The pupil nurses are required to spend three months in the sanatorium during this period they receive training and lectures which give them a good foundation for tuberculosis home visiting.

For the past few months the nurse engaged in private duty has found it very difficult to find enough work to do owing no doubt to economic conditions. This has forced the private duty nurse to offer her services on an hourly basis. She may therefore adopt this system hereafter and really become unconsciously a health visitor.

District nursing has been termed the most successful form of charity. At first the visiting nurse dealt with every form of illness and emergency but with the increasing emphasis on prevention many specialists have been brought forward. All of them are concerned with improved means for nursing the sick and for preventing illness naturally the training required must be variable.

I read a short time ago in one of the journals that among 1974 health visitors there were twenty two different certificates or varieties of experience and eighty-eight combinations. Some had no certificates others had up to five each. Some had no training others had up to eight years' training. This condition of affairs is due no doubt to inability to secure properly trained health visitors rather than to indifference on the part of those engaging their services.

In Western Canada at least the problem of training the health visitor must be solved by securing the co-operation of the universities. The supply of trained health workers is inadequate and the demand must be met.

ULCERATIVE COLITIS ITS TREATMENT BY IONIZATION

Summary of Twenty-eight Cases *

BY

JULIUS BURNFORD,

PHYSICIAN TO THE WEST LONDON HOSPITAL, THE LONDON JEWISH HOSPITAL, AND ST MARY ABBOTS HOSPITAL, KENSINGTON

With a view to estimating the value of ionization as a treatment for colitis an analytical summary was prepared of a consecutive series of cases dealt with in this way In some, ionization was the sole treatment, in others, it was tried after various other methods had failed In two cases emetine was given at the same time by impatient observers, although it was extremely doubtful that the patients could have been infected with amoebic dysentery Included in this series were several fatal acute cases which ran a very rapid course, and some chronic cases which were apparently incurable

In all there were twenty-one cures Six patients relapsed, and four were again treated with satisfactory results, the other two, who did not carry out the instructions, failed to get relief at other hospitals Two failures are still alive, but one of these ascribes the improvement in his general health and increase in weight (2 st 11 lb) to the ionization Another who refused the treatment had a colectomy performed Three patients were too ill to stand the treatment One case of spontaneous cure without any special treatment is of importance in assessing the value of treatment

All the patients but one were treated in hospital—the West London Hospital, the London Jewish Hospital, and St Mary Abbots Hospital They were seen in conjunction with colleagues, who are responsible for the reports on the sigmoidoscopic examinations

The first case was treated in 1923, and the detailed history is instructive

M R, a married woman, aged 33, had been in the London Hospital for nine months (June 29th, 1922, to February 26th, 1923) with ulcerative colitis She had suffered for four months previously with diarrhoea and the passing of blood and mucus An appendicostomy had been performed and daily lavage given, but when seen at home after her discharge she was very ill, and had been sinking for some time She was admitted to the London Jewish Hospital in a condition of collapse, being very emaciated Grey slimy stools were passed every half-hour, accompanied by constant abdominal pain and persistent vomiting Around the appendicostomy wound there was extensive sloughing and leakage of faecal material The weight on admission (July, 1923) was 4½ stone At my request Captain Marsh started ionization the *day after admission with 2 per cent* zinc sulphate, using the appendicostomy wound for the positive electrode This was repeated three times weekly and the bowel washed out daily with hypertonic saline Improvement was noted from the commencement of the treatment the vomiting ceased the appetite returned, the pain did not recur, and within a fortnight the stools had decreased to five in the twenty four hours and she had increased in weight (August 8th) On September 5th she was much improved but the treatment was interrupted for a month During this time she had daily lavage, but the stools increased in frequency to eight daily While no blood or mucus was passed, the faecal fistula around the appendix appeared to be spreading Ionization was started again on October 8th, this time the bowel being filled with zinc sulphate Three days later there was a considerable improvement, the stools were brown and partially formed the wound was looking better and the leakage was less Ionization was continued at weekly intervals and she was discharged on November 30th The appendicostomy was almost closed but there was still a slight faecal leakage She attended the out patient department regularly In January 1924, when she weighed 7 st 11 lb, she reported traces of blood in the stools, so ionization was again started and maintained at weekly intervals *for a time She was then on a normal diet, and had no diarrhoea* In May she was admitted to the surgical wards for closure of the very small faecal fistula which remained This was done by Mr Slesinger since then her condition has been normal She was seen in February 1925 and was perfectly well, her weight being 10 st Recently she reported that her good health had continued, and that her weight had increased to 11 st

Further work on these lines has confirmed the impression that ionization has the same striking effect on ulcers of the colon as it is known to have on superficial ulcers and sinuses In certain cases treatment failed, this might be explained by an appreciation of the extent of the pathological processes All the cases gave evidence of inflammation of the bowel, the stools or diarrhoeic flux containing pus and blood with admixture of mucus In most the sigmoidoscope revealed ulcers in the rectum and pelvic colon, but these parts in some of the cases were not affected In one or two, at a previous operation, ulcers had been determined in the colon None showed evidence of bacilli or specific organisms

The symptoms are not always proportionate to the extent of anatomical lesions Sometimes the toxaemia is extreme with slight lesions, though this is usually not the case, and exhaustion from diarrhoea is the outstanding symptom In one fatal case with a long history of diarrhoea a thickened, enlarged, and chronically inflamed appendix was removed, but death occurred from exhaustion There were only a few small scattered ulcers in the colon In patients who recover there is no evidence of the full extent of the damage

Our earlier knowledge of the disease, based on post mortem and museum specimens, pictured it as of uncommon incidence, generally occurring in middle age, resistant to treatment, and terminating after a long course by exhaustion In these chronic cases the mucosa is extensively destroyed throughout the whole or greater part of the colon, with exposure and even invasion of the muscular coat, in places the remnants of mucous membrane give the appearance of polyposis, in some cases the wall of the gut has hypertrophied and become pigmented In the chronic variety the microscope reveals diffuse inflammation spreading throughout the intestinal coats, and even fibrosis It is difficult to see how so extensive a destruction of tissue could be repaired under any treatment Most of the fatal cases met with have been of this type Some acute cases run so rapid a course that death occurs in a few days, here again there is often extensive destruction of the bowel wall

Long experience suggests an increasing incidence of alimentary ulcers Many more cases of acute and subacute ulcers are noted than can be accounted for by more refined instrumental methods of diagnosis For a time these are merely superficial erosions, though, as in the case of peptic erosions, they are not always dissociated from serious symptoms It must be recognized that these erosions can heal spontaneously This can be verified by sigmoidoscopic examinations The etiology of these ulcers is unknown The only factor common to all the cases is constipation, in some cases stubborn, and lasting as long as a week In one case there was not even diarrhoea All the patients on being discharged were prescribed liquid paraffin in one or other of its elegant preparations, and advised to persist with it

Duration of Symptoms

The duration of symptoms prior to treatment is a variable factor and difficult to determine Nor can the time factor be regarded as invariably indicating the extent of the mischief Most of the patients had diarrhoea with "blood and slime" for a few months only In Case 6 there was recurrent diarrhoea for nine years, in Case 3 blood was passed for ten years, but blood and slime for only eight months One patient had a definite acute onset one year and two months previously, and another had symptoms for a year Of the unsuccessful cases, one patient had acute symptoms for four years Some, however, were of short duration Nevertheless, my impression is that the longer the disease has progressed the less certain is the cure

Appendicostomy with subsequent lavage—the treatment recommended by most surgeons—had been tried in some cases Colon lavage with various saline and astringent solutions had failed in others In some antidysenteric serum had been used, but without the striking results reported by some observers

* Since submitting this summary for publication five more cases have been under treatment with strikingly successful results A detailed analysis of all these cases will be presented at an early opportunity

	Name	Age	Duration of Symptoms	Sigmoidoscopy	Duration of Treatment	Ionization	Result	Relapse	Remarks
1	M R	33	18 months	Too ill	21/7/23–30/11/23	Thrice weekly	Cured	No	Case reported in text
2	M A	28	Months	Ulceration	29/10/26–2/12/26	× 10	Cured	No	"Terrific constipation"
3	M R	3	10 years	Ulceration	6/12/27–29/3/28	Weekly	Cured	No	Recurrent attacks of diarrhœa
4	M A	35	Months	Ulceration	11/6/28–1/7/28	× 6	Cured	Yes	Relapse accompanied constipation
5	R B.	2[illegible]	5 weeks	Ulceration	16/7/28–25/8/28	Twice weekly	Cured	No	Rapid improvement. Weight increased 1½ st.
6	T F	43	9 years	Hæmorrhagic ulceration	11/2/30–5/5/30	× 8	Cured	No	Pea-green diarrhœa with arthritis
						× 11			Preceded by constipation.
7	S K	37	7 months	Ulceration	31/1/29–21/3/29	Twice weekly	Cured	Yes	Relapse accompanied constipation
8	R B	53	2 months	Ulceration	23/10/28–8/12/28	× 7	Cured	No	Stubborn constipation for years preceded attack
9	S D	35	5 months	Ulceration	22/11/28–21/1/30	Twice weekly then once	Cured	No	Very intractable case. Intolerant of treatment and very anæmic.
10	A W	57	Months	Ulceration	2[illegible]28/10/28–5/2/30	Twice weekly	Cured	Yes	Rapid improvement
						× 5			
11	E P	21	2 months	Ulceration	5/2/30–31/3/30	× 12	Cured	No	Regained 2 st. in weight by Sept., 1929
12	L J	22	Months	Hæmorrhagic	12/1/29–22/3/29	× 9	Cured	Yes	Admitted as suffering from chlorosis. Under treatment for relapse
13	W W	30	9 months	Ulceration	19/3/30–2/6/30	× 6 from 19/7/28	Cured	No	Serum and lavage ineffectual
14	A J	59	5 months	Hæmorrhagic	25/7/29–7/8/29	× 8 from 7/7/28	Cured	No	Lavage for one month ineffectual.
15	L B	43	8 months	Ulceration	12/5/25–17/8/25	× 3 from 27/12/29	Cured	Yes	Lavage ineffectual. After ionization stools normal
16	F C	5	14 months	Ulceration	31/10/29–31/12/29	Began 6/1/30	Cured	No	Appendicectomy and lavage ineffectual. Emetine used
17	G C	23	6 weeks	Injected mucosa	1/12/29–1/3/30	× 8 from 19/12/29	Cured	No	Serum and lavage ineffectual. Emetine also given. no evidence of dysentery
18	P N	53	10 days	Ulceration	13/11/29–31/1/30	× 3 from 5/1/28	Cured	No	Improved under lavage but relapsed
19	M C	35	2 months	Ulceration	27/7/28–3/11/28	× 6	Cured	No	Rapid cure after ionization.
20	S H	23	1 year	Ulceration	21/5/30–12/7/30	× 5	Cured	No	Hyperchlorhydria. Rapid improvement.
21	F C	—	8 months	Ulceration	21/7/30–19/11/29	× 19	Failed	—	Preceded by constipation and arthritis. Rapid improvement.
22	I F	43	10 months	Ulceration	21/8/29–31/7/29	Via appendicostomy	—	—	Gained 1½ st.
						Per rectum	Failed	—	Appendicostomy and lavage ineffectual
23	J C	24	4 years	—	15/3/29–30/11/29	Frequent	Died	—	Under ionization weight increased from 6 st. to 8 st. 11 lb. but ulcers remained
24	L D	—	Months	Ulceration	25/1/29–18/2/29	Into errant	Died	—	Appendicectomy. Transverse colostomy. Ulcers in transverse colon, which bled readily
25	C W	21	3 months	—	4 days	Too ill	Refused to continue	—	Discharged himself and was treated elsewhere with serum and lavage but died in a few months.
26	Mr	—	Years	—	—	Through appendicostomy × 3	Died	—	Extensive destruction of mucosa of entire colon. Peritonitis
27	Mrs	45	Months	—	Months	Intolerant	Cured	—	Improved after ionization but ceased treatment. Colectomy
28	— S	30	6 weeks	Ulceration	14/1/25–3/2/25	No treatment			Lesion confined to pelvic colon. Extensive ulceration for six inches
									Constipation. Spontaneous cure with liquid paraffin

Technique

In the earlier cases daily lavage was employed but patients at times became intolerant of this and rendered the ionization difficult. There is no sound argument for sluicing the bowel contents. It can neither rest the gut nor disinfect it for within a very short time of washing out the colon the contents become foul again. In the later cases, therefore, the daily lavage was omitted and castor oil was administered twenty-four hours before each ionization.

A special flushing electrode was used. This was made for me by the Medical Supply Association. The ionization is carried out while the zinc solution is passing in. At first 2 per cent. solution was used, but latterly only 1·2 per cent. in quantity up to the limit of tolerance. At first only a little may be tolerated with 2 or 3 ma. of current but finally three pints may be held whilst a current of 20 ma. is passing for fifteen minutes or longer.

The dietetic factor is important in view of the nutritional disturbance. It is not possible to alter the consistence of the contents of the colon to any extent by varying the food given by the mouth. The solid residue from a purely milk diet cannot be less irritant to a diseased colon than that resulting from a light diet more varied more palatable and certainly more nutritious to an adult. Hence a liberal light diet was always allowed.

Several manifested a hypochlorhydria and some achlorhydria. In these hydrochloric acid in doses of half a drachm was given together with glycerin of papain.

Cure is judged by the presence of normal stools containing no pus and to a lesser degree—as only a part of the bowel falls within the field of vision—sigmoidoscopic evidence.

Relapses

Relapses are liable to occur in all cases of ulcerative colitis in my series there have been several. These, however, have been of a mild nature and have readily responded to treatment where the patient returned for advice early. In each of these the relapse was caused by indiscretion of diet or a return of constipation. Apart from those shown in the table, no other relapses have occurred up to the present time.

An important point is the secondary anæmia which often supervenes. This is at times resistant to treatment. One patient (Case 12) has returned to hospital for a blood transfusion which, I think, could have been done with advantage much sooner. This patient was actually sent to hospital as suffering from chlorosis with a hæmoglobin content of 21 per cent., colitis was diagnosed only after admission.

In conclusion it would seem from the evidence here adduced that in ionization we have a distinct advance on previous methods for treating ulcerative colitis.

The first case was treated at my request by Captain Marsh but the remainder have been done by me with the assistance of my various house-physicians to whom I am indebted for carrying out with so much patience the detail essential to success.

THENAR AND HYPOTHENAR TYPES OF NEURAL ATROPHY OF THE HAND

BY

J RAMSAY HUNT, M D,

SENIOR ATTENDING NEUROLOGIST, NEW YORK NEUROLOGICAL INSTITUTE

In the *British Medical Journal* of January 19th, 1929, Dr Wilfred Harris reports two cases of occupational pressure neuritis of the deep palmar branch of the ulnar nerve, one occurring in a bootmaker and the other in a motor cyclist In his comments he states

"Until recently I have never seen a pressure neuritis of the deep palmar branch of the ulnar, nor do I know of any description of such a condition, but two cases which I saw within a week were so clearly limited to this nerve branch that possibly its apparent rarity may be due to want of recognition"

This statement, coming from a well-known English authority on disorders of peripheral nerves, would appear to indicate that the clinical picture which was described by me some twenty years ago has not gained recognition in Great Britain In American literature it has long been recognized and has appeared in some textbooks and medical dictionaries as a special form of atrophy

The neural form of atrophic paralysis of the small muscles of the hand, without accompanying sensory disturbances, may be caused by compression neuritis of either the deep palmar branch of the ulnar nerve or the thenar branch of the median nerve, both of which subserve a purely motor function

Atrophic paralysis of the small muscles of the hand occupies a position of peculiar importance in the symptomatology of nervous disease because of the great variety of pathological conditions in which it may occur as an important and often early symptom It may follow involvement of the spinal cord, the anterior nerve roots, the brachial plexus, and of the ulnar and median nerves As a rule, the associated sensory disturbances or the absence of sensory symptoms play an important and often determining part in diagnosis and the topographical localization of the lesion, indicating its neural, plexus, radicular, or medullary origin, as the case may be

The types of *neural* atrophy of the hand which I have described are characterized by a strictly neural distribution, with complete absence of those disturbances of sensibility which usually accompany lesions of the median and ulnar nerves For this reason they resemble, more or less closely, certain of the myelopathies and myopathies beginning in the small muscles of the thenar, hypothenar, or interosseous regions of the hand

This peculiar form of neural atrophy results from a neuritis or compression of purely motor branches of the ulnar and median nerves, and may be divided into a thenar and hypothenar type In the *thenar* group the atrophy is limited to the muscles of the thenar eminence supplied by the median nerve, and is the result of compression of the thenar branch as it passes beneath the anterior annular ligament of the wrist The *hypothenar* group is characterized by paralysis with atrophy of all the small muscles of the hand supplied by the ulnar nerve, and results from compression of the deep volar branch as it passes between the tendons of origin of the short abductor and the short flexor of the little finger Both of the compressed nerves are purely motor in character, which explains the occurrence of neutral atrophy without disturbances of sensibility in their respective distributions

Of the hypothenar type six cases were described in my early studies, all of which were unilateral and identical in symptomatology In all, there was a complete paralysis of the intrinsic muscles of the hand supplied by the ulnar nerve, without sensory disturbances In two of the cases in which this symptom was investigated the function of the palmaris brevis muscle was preserved This peculiarity is explained by the anatomical distribution, the filament supplying this small subcutaneous muscle is given off from the superficial palmar branch of the ulnar nerve, and so escapes injury in the compression of the deep palmar branch Complete reactions of degeneration were observed in all of the cases, strictly limited to the ulnar distribution in the hand

Of the thenar type four cases have come under my observation, in two of which the atrophy was unilateral and in two bilateral In all four cases, including those in which the atrophy was bilateral, the clinical features were identical—namely, paralysis with atrophy of the muscles of the thenar eminence innervated by the median nerve, with reactions of degeneration and complete preservation of sensibility in the distribution of the median nerve Since these cases were published I have occasionally encountered the condition in both private and hospital practice, and I do not consider it a great rarity In my experience it has often been confused with atrophy of spinal origin

The neural atrophy in both the thenar and hypothenar group may come on gradually, following in the wake of the paralysis, and in this way a certain progressive tendency may be manifested in the earlier months, which may simulate very closely a beginning spinal atrophy of the Aran-Duchenne type In some of my original cases an early progressive muscular atrophy had been diagnosed because of the localization of the atrophy in the small muscles of the hand and the absence of sensory disturbances A discussion of the various occupational factors and the differential diagnosis relating to other forms of atrophy will be found in the references to my earlier publications

MEDICAL, SURGICAL, OBSTETRICAL.

INJECTION OF WHOLE BLOOD FOR FURUNCULOSIS

Cases of recurrent crops of boils are usually resistant to treatment Among other methods the injection of colloid manganese helps in some cases, but I have never been satisfied that this is an efficient treatment While serving in India, where furunculosis is common in the hot weather, I adopted a method which proved to be remarkably successful and in some cases dramatic in its cure I do not claim the method is new, but I have never come across anyone using it

Five c.cm of blood are withdrawn from a vein at the elbow, and immediately injected into the muscles of the buttock A 10 c.cm syringe is used with a peripheral nozzle and two needles If the syringe is kept in spirit it should be carefully washed out with distilled water The site of election for the intramuscular injection is the upper and outer quadrant of the buttock, since this part is free from large vessels and nerves If a line is drawn outwards from the top of the gluteal fold and bisected by a perpendicular line this will give the four quadrants, the upper and outer of which should be used for intramuscular injections in this region The spot for injection is marked by a daub of tincture of iodine One needle is fitted to the syringe, the other lying handy in distilled water, 5 c.cm of blood are now withdrawn from one of the veins at the elbow, and the needle is detached from the syringe The second needle is driven sharply into the marked spot on the buttock and, after waiting a moment to see that no blood flows, the nozzle of the syringe is applied to the needle and the blood is injected

I have found that existing boils dry up within twenty-four hours as a rule, and the formation of further boils is prevented In only one case was a second inoculation necessary after a lapse of four days

EFFECT OF ACTIVATED FLUORESCEIN ON GROWING BEANS

The following note may be of interest since at present the effect of "activated" fluorescein is a much discussed point

During the last year I have been investigating the effect of x rays on growing bean roots (*Vicia faba*) and found that irradiation for two minutes at 120 Kv 4 ma and 23 cm distance (SED x Solomon's unit) caused a cessation of growth seven days after irradiation while larger doses produced an earlier and more marked effect.[1] The methods employed for growing and measuring the bean roots have been described in a previous paper[2] For the experiments four groups of beans were taken which had been growing for the same length of time, with roots of approximately equal length

Group 1 Irradiated only

Group 2 Placed in 2 per cent solution of fluorescein for one minute and then irradiated

Group 3 Placed in 2 per cent solution of fluorescein for one minute

Group 4 Neither irradiated nor treated in fluorescein

As a result of several experiments with different duration of x ray treatment during which the beans were covered with black paper it was found that all the roots of the beans which had been dipped into fluorescein were shorter than those in the other groups and taking this fact into consideration it was found that the roots of those which had been both irradiated and treated with fluorescein were only very slightly proportionately shorter than those which had been irradiated only From this slight difference was not observable on the one occasion on which the beans were irradiated without being covered with the paper Stunting of growth never occurred any sooner in the roots of the beans which had been treated with fluorescein and x rayed than it did in bean roots which had been x rayed only and since the bigger the dose the sooner stunting occurs the experiments would suggest that the intensifying action of "activated" fluorescein on x rays is negligible

Four more groups of beans have been similarly treated and microscopic preparations made from the root tips at varying length of time after irradiation in order to determine if fluorescein has any effect on mitosis but the results of these observations are not yet ready for publication

I am indebted to the British Medical Association and the Medical Research Council for grant in aid of work of which these experiments formed part and to the Master and radiologist of the Pounda Hospital Dublin for allowing me the use of their x ray plant

THE STETHOSCOPE

PRESIDENTIAL ADDRESS TO MEDICAL SOCIETY OF LONDON

At the first meeting of the session of the Medical Society of London on October 13th, the new president Dr P A Young was inducted into the chair, and delivered his presidential address the subject of which was "The stethoscope past and present" The address was illustrated by an exhibit of old instruments and books from the Wellcome Historical Medical Museum and other sources

Dr Young said that he had chosen to speak of the stethoscope as a symbol of clinical medicine, not because he regarded it as indispensable, but because he feared that a study of physical signs including the use of the stethoscope was being relegated to a subordinate position relying upon laboratory results having to some extent usurped its place Progress in all branches of knowledge involved change sometimes constructive and at others destructive readjustment not infrequently led to the loss of useful things and the neglect of fruitful ideas In the establishment of the clinical method Laennec himself played no inconsiderable part Undoubtedly he would have made an undying name for himself as a morbid anatomist and a scientific physician, even if he had not invented the stethoscope The great morbid anatomists who succeeded him investigated the topography of disease by their careful and laborious post-mortem researches Morbid anatomy however demonstrated only the localizations the tissue reactions and the terminal results of disease The application of the microscope to the study of diseased tissues and the further developments of bacteriology served to attract attention to the processes of disease themselves A great clinician the late Sir James Goodhart drew general attention to these matters in his Harveian Oration in 1912, under the arresting title of "The passing of morbid anatomy" Since that time bacteriology had come to the forefront and in its turn was being superseded by biochemistry Laboratory developments including x ray examinations tended to dominate medicine, and there was a danger Dr Young feared of the passing of clinical medicine There was a risk lest in enthusiasm for the new what was valuable in the old should be jettisoned He yielded to no one in admiration for what the laboratory worker was doing but he wished to plead for a due perspective in these matters One of Laennec's great gifts to the physician was the stethoscope Before his time the equipment of the physician consisted solely of his senses—sight, touch smell and unaided hearing on the information afforded by these senses he employed his intelligence and experience to make his diagnosis and devise his treatment Certain mechanisms of simple type such as the wheel pulley lever, and crowbar were so fundamental and essential that it was difficult to conceive of civilized life without them To such an order in medicine, the stethoscope would seem to belong But times were changing and to judge from correspondence in the medical journals it was now regarded as an obsolete instrument like the lancet the bistoury and the cupping apparatus One writer stated that the earliest beginnings of pulmonary tuberculosis were associated with often quite negligible stethoscopic signs to be supplemented by serial skiagrams It was even suggested by another that the course of this disease could be controlled by x-ray procedures entirely apart from other physical methods Yet another considered that the time had come when it must be recognized that chest radiology had proved that much of the former teaching was wrong and that the x ray tube was a far more searching apparatus than the instrument of Laennec Dr Young thought it might serve a useful purpose therefore if he tried to sketch briefly the development of the classical routine—inspection, palpation, percussion The earlier physicians were of necessity obliged to rely chiefly upon the clinical history and what they could observe with their eyes and ears, but their studies of the history and symptoms, and their powers of observation were profound The first substantial advance in physical examination had been made by Auenbrugger of Vienna, who introduced the art of percussion This great and modest genius worked for seven years before he published in 1761, his very brief masterpiece His invention was opposed and soon forgotten but it survived in Piorry's plexímeter one form of which the speaker exhibited, mentioning that he had picked it up in the Caledonian Market some years previously Stokes of Dublin had the credit of introducing finger-to-finger percussion What Stokes did was to apply the dorsal surface of the plexímeter finger to the chest thus reversing the present procedure The plexímeter to-day was only interesting as a curiosity

Laennec first used the stethoscope in 1816 He read a paper on the subject in February 1818 and published the first edition of his immortal *Traité de l'Auscultation médiate* in August 1819 Dr Young exhibited a first edition of the treatise which he had borrowed from

OSLER AND McCRAE

THE eleventh edition of Osler's *Principles and Practice of Medicine*,[1] edited by Professor THOMAS MCCRAE, follows the tenth (also brought out solely by the original author's pupil and friend) after an interval of five years. Since it first came out in 1892 well over a quarter of a million copies have been sold, and the characteristic features have not only been preserved, but in the numerous additions the editor has shown the same concise and epigrammatic style that made the earlier editions so attractive. With the rapid changes in medical knowledge and conceptions, the writer of a textbook is faced with many difficulties, and among the most anxious are decisions whether or not new ideas will stand the test of time, and how much to notice or excise, there is, therefore, the temptation to add rather than to prune, and textbooks tend to grow in size, though not always with corresponding value. This pitfall Professor McCrae has successfully avoided, for, though there are many additions, the maximum amount of information is conveyed in the minimum space, with the result that the size of the volume remains almost exactly the same.

The preface calls attention to twenty-four new items, and to a number of the more important changes, but there are, of course, others, such as the liver treatment of Addisonian anaemia, and the editor may well be forgiven if he has lost count of them all. Among the interesting additions mention may be made of poisoning by the radio-active substances, mesothorium and radium, due to oral absorption of luminous paint for clock dials (which causes necrosis of the jaw with changes in the bones) and aplastic anaemia. Post-vaccinal encephalitis, as seen in this country and in Holland, is succinctly described in two different parts of the volume. A short section on miscellaneous affections of the locomotor system contains accounts of Albers-Schonberg's disease, or marble bones, Christian's syndrome of defects in the membranous bones, exophthalmos, and diabetes mellitus, which Rowland of Detroit regards as allied to Gaucher's and Niemann's diseases, and a form of generalized xanthomatosis due to disordered lipoid metabolism. The numerous admirers of this favourite textbook will welcome the retention of the summaries of the morbid changes, and the historical touches which adorn the accounts of various diseases.

This year has also seen the fourteenth edition of Taylor and Poulton's *Medicine*, which originally appeared two years before Osler's *Medicine*—two standard textbooks in which English-speaking medicine is portrayed at its best.

ALLERGIC DISEASES

THAT the title of a monograph which has run through two editions in four years should be changed completely in a new third edition needs some explanation. On perusing Dr. RAY BALYEAT'S *Allergic Diseases* the reason is obvious at once for in his study of asthma and hay fever the author has fallen in with the most up-to-date views, and presented his extensive experience with hundreds of cases of migraine, eczema, and urticaria, as well as with a few selected instances of epilepsy and abdominal pain. The absence of any reference to Henoch's purpura, mucous colitis and some forms of arthritis or bladder pain is noteworthy, but the allergic basis of some of these disorders is at present not so well established. The change in title may appear antithetic to the statement in the preface that the work is couched in "non-technical terms so that it can be easily understood by the average patient," especially as all reference to allergy is omitted from the author's explanation of technical terms. Nevertheless, to students of, or sufferers from, allergic reactions such a monograph is particularly welcome. Advances in diagnostic technique and treatment are occurring rapidly, and the recent publicity this subject has received, in both the medical and the lay press, has created in many a desire to know the rationale of each new procedure. Balyeat deals admirably with this aspect of the subject, not only giving excellent advice to suit the needs of the ordinary patient, but also providing a clear and interesting account of the main facts of allergy for the general practitioner, who, in this country, will be pleased to know that English physicians were the pioneers of clinical allergy, in spite of the fact that its manifestations are not so common on this side of the water. The sixty pages devoted to plants indigenous to districts in the United States are more of local than of general interest, but the chapter on the etiological relationship of animals and fowls is impressive, and the importance, as a preventive measure, of forbidding pets in the home is well stressed. The author's finding that feathers, animal emanations, and dusts play a much larger part in the etiology than do foods, except in cases with onset early in the first decade, coincides with experience in this country, and underlines the influence of environment in determining specific sensitization. At the same time it should be realized that the tendency to manifest some form of allergic reaction is generally determined by heredity, and that other allergic conditions are prominent and inter related both in the individual and in his family. According to the author's experience, nasal abnormalities have but secondary importance in the etiology of allergic diseases. Infections, he believes, should be treated on general principles, and patients should be informed that nasal operations *per se* are seldom a cure. In 80 per cent of hay fever cases and 70 per cent of cases of asthma no operative procedure of any sort is needed. The beneficial effects of climate and of various renowned resorts are due to the absence or lessened activity of the specific allergens. The practitioner is well advised to have each case thoroughly tested before recommending any change, both to ensure that the patient shall be free from attacks while he is away and to obviate attacks on his return.

This monograph is written in a clear and interesting style. It is printed in large, bold type, on good paper, and is well illustrated and indexed. It can be recommended to both patients and practitioners as a guide to "what every asthmatic and hay fever sufferer ought to know."

"LA THERAPIE MECANIQUE"

IN his preface to Dr. GABRIEL BIDOU'S book,[2] Professor D'ARSONVAL says that the author has the rare merit of being not only a good clinician, but, at the same time, a good physician, mechanician, and physiologist. All these qualities are essential in the practice of "therapie mecanique" which is defined as being "the art of re-establishing the play of human articulations, lost or modified by disease or injury, by the judicious and discriminate use of special apparatus or mechanical devices designed for the requirements of functional recuperation." The apparatus which Dr. Bidou has invented is called an "arthromoteur." It is capable of giving all passive and resisted movements to all joints, at any amplitude or height, whether the patient to be mobilized be seated or lying down. The description of the general "arthromoteur" is detailed and lucid, and the notes given of patients treated by it and by the application of individual apparatus are most encouraging. Patients severely disabled by the sequelae of acute anterior poliomyelitis, such as paraplegia with contractures, have been enabled to obtain "functional recuperation." Bidou wants to call the attention of medical men to this new branch of medical science because of the important part it takes in curing static and dynamic alterations in the normal play of the constituent segments of the body the least modification of which can bring innumerable disorders in its train. "Therapie mecanique" should not be confused with mechanotherapy, which the author considers has neither the scientific basis nor the technique to entitle it to

[1] *The Principles and Practice of Medicine designed for the use of Practitioners and Students of Medicine*, originally written by the late Sir William Osler Bt. M.D. F.R.S. Eleventh edition, revised by Thomas McCrae M.D. F.R.C.P. New York and London: D. Appleton and Co. 1930. (Roy. 8vo. pp. xxxviii+1237. 23 figures, 15 charts. 30s. net.)

Allergic Diseases: their Diagnosis and Treatment. By Ray M. Balyeat M.D. F.A.C.P. Third edition revised and enlarged. Philadelphia: F. A. Davis Company. 1930. (6×9¼. pp. 395. 84 figures. 5 dollars.)

[2] *La Therapie Mécanique*. Par Dr. Gabriel Bidou. Preface du Professeur d'Arsonval. Paris: Vuibert. 1930. (6×8¼. pp. 104. 58 figures.)

stand as a therapeutic measure The book is written beautifully and the arguments are so logical and scientific that to read them is a pleasure We feel however that without the special gifts of the author and his talent for considering the body mechanically other workers might lose sight of the desired end through preoccupation with the complexity of the apparatus

TREATMENT OF PULMONARY TUBERCULOSIS

A recent addition to the Modern Treatment Series published by Jonathan Cape is *The Surgical Treatment of Pulmonary Tuberculosis* by Dr Bernard Hudson It is a well produced book of 128 pages without illustrations just the right size and written in the right style, for a work of this purpose The whole field of the treatment of pulmonary tuberculosis by collapse of the lung is covered and since the balance is good the general practitioner reader without previous special knowledge of the subject should get exactly the information he needs, and that in good perspective The class of patient among whom Dr Hudson has worked for so many years in Switzerland presents a slightly different problem to that which has to be faced by those who are treating tuberculosis in the English working classes so that the teaching would be somewhat different in detail if presented by a physician of the same experience in England but the essentials are the same The tone of the book is rather gloomy—a wise attitude when dealing with modern treatments still in the stage of development

Dr J Kamiekstis publishes a short monograph on the treatment of pulmonary tuberculosis with benzinol Its action he explains is to produce a local inflammation in which there is a rapid destruction of blood corpuscles whereby ferments stimulating phagocytosis and bacteriolysis are set free A 30 per cent solution of benzine in olive oil is used The injections are intramuscular A harmless local reaction and a focal reaction are produced The initial dose is from 0 05 to 0 3 c cm , the rate of increase being by 0 025 c cm or 0 05 c cm The author is emphatic that the size number and frequency of the injections must be suited to the individual case There are no contraindications and very good results are claimed No details of actual cases are given

What the General Practitioner must know of the Surgical Treatment of Pulmonary Tuberculosis" is the title of a small book of sixty pages with twenty-eight excellent illustrations by Dr Hans Alexander Under surgical treatment Dr Alexander includes all forms of treatment by lung collapse and in this monograph he gives his readers a very comprehensive summary of the present-day German views on the subject The book can be recommended

Dr Kang's *Handbook on Tuberculosis* is a hurried survey of the whole field of tuberculosis in all its forms A useful book for nurses and social workers

THE GOLF STROKE

However much we take to heart the caution of Sir Farquhar Buzzard against advising our patients to play golf there is little doubt that we shall continue to prescribe it for ourselves, and therefore Dr James Forrest's *The Golf Stroke* will interest many doctors as well as laymen The book is a sequel to *The Basis of the Golf Swing* published in 1926 by the same author Every golfer knows too well the endless variety of errors which creep into his game causing him to fall short of that somewhat imaginary standard of excellence which he is pleased to consider his proper form Dr Forrest would have us believe that however numerous and varied the errors may be, they all arise from the same fundamental fault in striking the ball We use the wrong stroke and not the "right" stroke Here we have the one stroke contrasted with the other with great detail and many excellent photographs and a series of exercises calculated to eradicate the wrong style and promote the right while our imagination is inspired with the golden vision of the rapid evolution of the tiger from the rabbit We fear there will be some whose faith in patent medicines for golf diseases is exhausted Others may think the price (22s 6d) prohibitive Others again, may still cherish the hope that if only they can discover that elusive sin which besets their game they will leave the broad and easy way which leads to perdition and enter the narrow path that is so difficult to find and hard to follow To these we can only express the hope that the study of this book will be rewarded by some at least of the good results which the author promises

NOTES ON BOOKS

The Growth of the Mind, by Sir Robert Armstrong-Jones is the ninth of the series of Henderson Trust Lectures The essay is eminently readable and in condensed form covers a good deal of ground in a manner which the student will find helpful The various definitions and conceptions of mind are discussed and an account is given of the development of the nervous system from its elementary form in the medusa up to its most complex form in man Diagrams serve to illustrate the text

The veteran Dr A Rabagliati who has practised in Bradford for just over sixty years, has brought out a second and expanded edition of his *Initis or Nutrition and Exercises*" which originally appeared in 1916 The morbid condition which he has labelled initis is regarded as a congestion of the connective tissues of the body although admittedly there is not any microscopical evidence to support this view It evidently covers fibrositis and muscular rheumatism Excess in diet and particularly the afternoon tea meal is blamed for this condition and exercises are recommended as the means of cure Although the details of the regimen may leave room for criticism the two principles of moderation in diet and the value of passive exercise in the form of massage remain as a sound basis for health

The production of a second edition of Dr E K Rideal's *Introduction to Surface Chemistry*" is a welcome sign that the book has met with widespread appreciation So much has been added to our knowledge of this subject in recent times that an arrangement and connexion of the facts was needed and Dr Rideal's many contributions to this knowledge fitted him singularly for the task of such a presentation Biological chemistry which is so largely a study of the behaviour of colloidal matter can only be properly followed with the help of a knowledge of the special properties of surfaces and the reactions which take place at interfaces Dr Rideal's book is an appreciative compendium of the researches accomplished and the theoretical views to which they lead

Dr A Neumann has published a pamphlet on the results of Dr Salzborn's method of treating carcinoma"—a worthless paper The treatment consists in the oral administration of two powders—grey and white—with a few drops of some liquid Of sixty-nine cases of what are stated to be certainly carcinoma one case is recorded as cured Protocol No 7 1915 Total extirpation on account of uterine carcinoma 1923 Ablation of right breast At the time there existed metastases in the second and third dorsal vertebrae according to the diagnosis made in the radiological department of the first surgical clinic the patient failed to reveal this fact to the operating surgeon A month after the operation Dr Salzborn commenced treatment at first regularly during three months

subsequently at gradually increasing intervals up to 1927 For four years the patient has been able to work, the sensations in the dorsal vertebrae gradually diminished, and, examined in February, 1929, the spine was found by Dr Neumann to be normal" Of the remaining cases the majority are stated to have been improved, the following may serve as an instance 'Protocol No 153 Supraclavicular metastasis after amputation of the breast Under Dr Salzborn since February 11th After three tablespoonfuls of the medicine breathing relieved, sleep better'

The Student Christian Movement Press has issued a booklet, *The Doctor's Job*,[1] by Dr A LLOYD WILLIAMS, to which Sir Donald MacAlister has contributed a foreword The book pleads with the student the cause of religion, and at the same time suggests to him attitudes towards such questions as psychotherapy sex birth control the panel, and the voluntary hospital system As Sir Donald MacAlister remarks, the reader may not always agree with the author's conclusions But the platitudes of most of the book are clearly stated, and their perusal should be of benefit to the newly fledged practitioner

Sanatorium[2] by DONALD STEWART, is advertised by the publisher as an unusual novel describing the life of a young man in a sanatorium for tuberculosis, which he leaves after twelve months' internment The author makes but little attempt to disguise his facts, and there is no difficulty in recognizing the sanatorium that he has in mind The tale is a pure mental autobiography, typical of hundreds of patients of the more intelligent type It depicts the intense seclusion of the sanatorium the pettiness self deception, and narrow jealousies of individual patients, the intolerableness of the communal life and most of all, the immensity of the mental gulf that separates the tuberculous patient from the normal person The book is gloomy, depressing, and indubitably true

Mr WARREN R DAWSON, in his studies in magic, mythology, and folklore entitled *The Bridle of Pegasus*,[3] at least demonstrates fully his claim to be a research worker The twenty pages of bibliography appended to his volume must have entailed many hours of patient toil The matter of the book is various It ranges from the amphidromia rite in which the Greek father ran naked round the hearth carrying his recently born child to the use of mouse and mummy in medicine Occasionally Mr Dawson advances an explanation of his own for some of the weird customs he describes He also points out how the slavish copying by one man from another and by one race from another preserved for centuries the long reign of tradition and precedent From time to time, however, error crept into the tradition Thus it came about that the early use of bitumen from the 'Mummy Mountain" in the territory of Darab as a drug in various diseases, became distorted into the horrible use of bits of mummy from Egypt in mediæval medicine It is probable that bitumen was never used for embalming by the ancient Egyptians The erroneous tradition may have arisen because many resins, and bodies treated with resins are black and lustrous like bitumen Even a late as the seventeenth century mummy was described as being "in much and excellent use in all countries of Europe", and as "the very body of a man or woman brought chiefly from Arabia or Syria (no other part of the world so good)"

PREPARATIONS AND APPLIANCES

COMBINED METAL MOUTH OPENER AND AIRWAY

Dr W J M CARDIE (Birmingham) writes Messrs Down Bros have made to my design a combined metal mouth opener and airway which I find very useful in anæsthetic work It is flatter than the ordinary boxwood wedge and usual type of airway, and has smooth, bevelled ends it is therefore more easily introduced between the teeth into the mouth, and cannot damage the throat It is made in three sizes

I think that this mouth opener and airway will prove helpful to others who give anæsthetics

MEDICAL SICKNESS, ANNUITY, AND LIFE ASSURANCE SOCIETY

THE annual general meeting of the Medical Sickness, Annuity, and Life Assurance Society, Ltd, was held at the First Avenue Hotel, High Holborn, W C, on October 8th, when Dr F C MARTLEY presided

Chairman's Address

Dr MARTLEY, in opening his address, referred to the heavy loss which the society had sustained in the unexpected death on August 31st, of Dr Charles Buttar, who had been a director of the society since 1921, and who had been of great assistance to the board in its deliberations Dr G de Bec Turtle had been appointed to the vacancy on the board Dr Martley also paid tribute to the services rendered by Dr T J Allan during his seventeen years as chairman of the society, and also when serving on the executive committee of the Friendly Societies The board was, he said, pleased to be able to retain his invaluable counsel and experience as a member thereof

With regard to the year's work, members would be glad to know of the continued progress of the company, which was particularly gratifying in view of some of the big financial crises which had taken place The practice purchase loan scheme continued to grow, and its success in meeting the requirements of the younger men on qualification was undoubted All instalments had been repaid, and no bad debts incurred He looked forward to an expansion of the house purchase scheme, which had been revised to meet the requirements of medical men purchasing their houses through the society The amount paid in sickness benefit during the past year was £1,300 less than the previous year, while the premium income had increased by over £6,000 The sickness experienced was about 67 per cent of the expectation, which compared favourably with that of the national health, which showed an experience of over 100 per cent of the expectation The premium income in respect of this class of business was the largest of any company transacting permanent sickness insurance The directors had considered the possibility of continuing the permanent sickness policy for members to the age of 70, but acting on the advice of their actuary they had decided against the proposal The new business of the life assurance fund had exceeded a quarter of a million sterling In 1922 the total sum assured was £182,042, whereas this year it totalled £1,368 716 The increase in the society's new business was especially gratifying in view of the fact that out of some forty nine assurance companies in the country only twenty seven had increased their business during the previous year With the continued growth of the work of the society, there was naturally an increase in expenses, caused by an expansion of office accommodation and additional staff The investments of the society were spread widely, and it was fortunate that they had not suffered in the heavy depreciation which had occurred in many securities A few stocks which were not repayable at par at a future date had been written down, but the auditors' certificate showed that in the aggregate the mean market prices of the stocks were still £9,840 in excess of the value stated in the balance sheet The sickness and life funds now amounted to £670 635, an increase of £64 150 Acting on the actuary's advice and recommendation the society was again able to propose the payment of the interim bonus at the same rate as was declared last year Dr Martley concluded his address by paying tribute to the loyalty and efficiency of the staff of the society

The annual report for the year ended June 30th, 1930 was adopted unanimously Dr T J Allan Dr W K Sibley, and Dr G de Bec Turtle were re elected to the board of directors, and Messrs Barber, Sturges, and Fraser were reappointed auditors

Payment of Bonus

The recommendation was unanimously adopted for the payment of an interim bonus on all with profit policies for permanent sickness and accident insurance and life assurances becoming claims during the year July 1st, 1930, to June 30th, 1931

On the motion of Dr T J ALLAN, seconded by Sir WILLIAM WILLCOX a hearty vote of thanks was accorded to Dr Martley for presiding at the meeting

Nova et Vetera.

MEDICINE AT ANTWERP AND GHENT

Dr. A. de Mets has published two small but valuable monographs under the titles *Iconographie Médicale Anversoise*[1] and *Iconographie Médicale Cantoise*,[2] which are of interest and value to the medical historian. They are not iconographies in the strict sense of the term but rather profusely illustrated accounts of the medical corporations in the two Flanders cities. Both monographs are dedicated to the memory of friends and colleagues who fell in the war, and both are printed on art paper in a limited and numbered edition and on ordinary paper for general use. The coloured plates are well reproduced and the text is illustrated with numerous engravings of places and persons connected with the story, foremost among them being Jean Palfijn, the surgeon and anatomist who was born at Courtrai in 1650 and proved himself a worthy fellow-countryman of Andreas Vesalius.

In 1238 the population of Antwerp was estimated at 8,000 and was served by the hospital of St. Elizabeth which even at that time had existed for more than two hundred years. It consisted of a large hall with a chapel attached and was presided over by a Mater who was a surgeon receiving an annual salary of ten Brabant schellings and a winter tunic. There is however no evidence of teaching until 1450 when the surgeons of Antwerp were formed into a corporate body governed by a president, two acting deans, past deans and a council. This corporation was dedicated to Cosmas and Damian, for at the first column on the left of the nisle in the cathedral was the altar of the "Confraternitas SS. Cosmae et Damiani." Dr. de Mets gives a picture of the cathedral showing the altar, which is of interest to us because the Barbers' Guild in London may have had a similar altar in St. Paul's Cathedral. The confraternity contained apprentices, compagnons and masters. It insisted upon its members attending lectures on surgery, which probably included anatomy, for periods of two to ten years, and rules were laid down for orderly conduct while they were being delivered.

The Corporation of Surgeons at Antwerp was established by order of the Governing Body of the City on July 13th, 1648, and from that time until the end of the eighteenth century there was a regular school of medicine with organized courses of instruction, disciplinary powers and a scale of fees. Dr. de Mets has rendered a valuable service by recording the names and dates of the presidents from 1659 to 1817, and to this list he has added a register of the certificates issued by the special School of Surgery from 1626 to 1794.

The medical teaching at Ghent seems to have centred round the ancient Byloke Hospital. It consisted, like other mediaeval hospitals, of a large hall with a raised platform at the east end for the altar, and Dr. de Mets is fortunate in being able to give a picture of it as it still exists. The medical teaching seems never to have gone much beyond that necessary for a barber-surgeon, but the pupils from Ghent supplied the Imperial armies with such surgeons as were required in their endless campaigns. The records of the guild show that the Barbers and Barber-Surgeons of Ghent had the same faults as their fellows in other countries. They were fined for putting basins of blood in their windows for shaving on Sundays, for going about the streets with bell and for crying their wares aloud in the city. Neither excommunication by the Church nor the infliction of fine by the guild nor civil process before the magistrates could wean them from their evil practices and they were not always free from the suspicion of keeping disorderly houses. On the other hand the guild prescribed that they were not to contract with their patients by the year but were to be paid per visit, that they were not to charge less than four mites for shaving, cutting the hair, making a tonsure, or for shingling. Cutting and combing—probably "lousing"—cost six mites. Four mites was the price for bleeding from the arm, but if the patient was bled from the hand, foot or other part of the body he had to pay a gros which was twenty-four mites. It cost a gros too, for the pulling of a tooth.

THE CUMBERLAND MATERNITY AND CHILD WELFARE SCHEME

The county health committee of Cumberland has recently approved a complete scheme of maternity and child welfare put forward by Dr. F. H. Morison, the county medical officer of health, the scheme is peculiar to the county, and has been adopted by the county council after the introduction of certain minor modifications by the Ministry of Health. Unlike most schemes of the kind, it is based on the co-operation of general practitioners, rather than on an extension of centres and clinics, and it has been considered and approved by the English Division of the Border Counties Branch of the British Medical Association. A letter sent out by the divisional secretary, inviting the support of practitioners in the area, has so far received replies which foreshadow hearty co-operation.

The Present Position

In setting out the scheme Dr. Morison touches on the services as they stand at present. Midwives trained in pelvic measuring, examination of urine, diagnosis of the position of the child, and general hygiene as well as in the conduct of normal labour are available in the county to the number of 101. Under the Midwives Act provision is made and extensively used for payment of fees to doctors called in by the midwife to the confinement or for certain conditions prior to confinement or to attend mother or child after a confinement. Specialist advice is available in cases of puerperal fever and puerperal pyrexia, and hospital accommodation of limited extent exists for the treatment of abnormal cases, patients living in unsatisfactory homes and septic cases. Centres are available for the treatment of venereal disease in pregnant women, and ante-natal and infant welfare clinics have also been established in many districts. It is found that expectant mothers attend only in small numbers but that the attendance of nursing mothers is fairly regular. In cases of puerperal sepsis provision has been made for bacteriological examination and for trained nursing assistance.

With regard to infant welfare the health visitor or the district nurse exercises supervision from the time the child is handed over by the midwife until the care of the school medical service comes in operation. All the midwives in the area are supplied with an outfit and with written instructions for the prevention of ophthalmia neonatorum, when cases of the condition are notified they are visited at once by the health visitor.

The maternal mortality of the county is high, and although the infant mortality has fallen by half during the past twenty years the maternal death rate has remained the same or even increased slightly. Dr. Morison's scheme begins with the care of the mother during the ante-natal period, and here co-operation on the part of the pregnant woman is essential. She should engage a doctor or midwife as early in pregnancy as possible, and it is recommended that both a doctor and a midwife should be engaged in every case. In order that a complete service may be available throughout the county five or six more midwives still require to be appointed. Handywomen are still employed as midwives in various parts, and in a few instances their activities have been supervised by medical practitioners.

Ante-natal Examination under the New Scheme

The scheme provides that ante-natal examination shall be made by a medical practitioner in every case either privately or at a clinic. This will have many advantages—notably that the doctor will have first-hand knowledge of the case if summoned to the confinement later, and that co-operation between doctor and midwife will be improved. The midwife is not competent to express an opinion on the general health of the mother, and since this may have an important bearing on the future of mother and child a medical examination is necessary in every case. The medical practitioner who makes the examination will, of course, be entitled to claim a fee

from the county council He will be required to report whether the case appears to be normal and suitable for attendance at home by the midwife, whether there are conditions rendering advisable the attendance of a doctor at the confinement, whether any further examinations or treatment are necessary, whether there are such abnormalities present as call for treatment in hospital, and whether the home conditions are unsatisfactory for the confinement In all cases, except those of women who have means to make private arrangements, the patient will be under the supervision of the midwife throughout pregnancy, and the midwife should inform her of the facilities offered by the local authority for her safety and comfort Advice on the preparation of infant clothes is obtainable at clinics, at the women's institutes, and from the midwife

If the doctor decides, as a result of his ante natal examination, that the opinion of a consultant is desirable, arrangements will be made for this to be available, the consultant, after conferring with the doctor and midwife, and advising as to treatment, will report to the county medical officer If an examination under an anaesthetic is necessary, provision will be made for a second practitioner to receive a fee, similarly, any ante natal treatment undertaken by the doctor will be remunerated, except in the case of insured women, who are entitled to ante natal care Provision of hospital accommodation for cases requiring ante natal treatment, such as facilities for transport by ambulance, and threatened miscarriages, will require to be made in every area In cases where the patient has not means to procure a suitably nutritive diet the onus of supplying her with adequate food falls on the maternity and child welfare authority, usually this will take the form of milk, either fresh or dry, and can be provided also during the natal and nursing periods Sterilized outfits for use in labour are already obtainable from the health department at a minimal cost, some arrangement may be made for their purchase during pregnancy at a cost of a little over 2d per week No provision exists at present for the dental care of expectant mothers, and the suggestion is put forward in the scheme that some arrangement should be made with dentists in private practice for this service

The Conduct of Labour

During the natal period, which includes the confinement and the ten days following a midwife should be present to act as nurse whether a doctor is attending the case or not Normal cases will be dealt with by the midwife alone, but in the event of some abnormality arising she must at once summon the doctor under the rules of the Midwives Board The doctor summoned will, of course, receive a fee, as will also an anaesthetist should one be required Arrangement for obtaining the assistance without delay of a consultant obstetrician if necessary is recommended under the scheme, at present except in cases of puerperal fever or sepsis, no such provision exists

Hospital accommodation required for abnormal cases is estimated at 5 per cent of the number of births in the county, or 150 cases yearly Taking the average stay in hospital as three weeks, nine beds would be required for this group of cases it is proposed that they should be dispersed through the county in existing hospitals, possibly in annexes to the main buildings Consultant services would be available at any of these hospitals The advantage of utilizing existing hospitals rather than establishing one or more maternity hospitals lies in the reduction of expense since no new equipment need be provided in addition many patients would suffer by a long ambulance journey which can be avoided by a wider distribution of beds Provision of beds for normal cases when the patients live in insanitary homes would not require such general distribution as the patients can be moved with safety It is not yet known how much advantage would be taken of such accommodation but should the various hospitals already mentioned be unable to meet the demand, it is suggested that beds might be provided in the Poor Law institutions lately taken over by the county council A suggestion is put forward that the council might find it economical to provide an ambulance for its own purposes, or to make an arrangement with the St John Ambulance Association for assistance

Post-natal Treatment

The post natal period extends from the ten days during which the doctor or midwife is responsible for the case until the mother has completely recovered During this time the health visitor or district nurse will advise the patient to consult her doctor for a post natal examination It is recommended that in case of illness of mother or child during the three months following confinement the health visitor should be required to register a request for medical assistance with the maternity and child welfare authority, if the request was considered to be reasonable the doctor would be informed, and would receive the same fee as for an ante natal visit Arrangements for obtaining the opinion of a consultant could be made at one of the hospitals, if necessary, and operative treatment could be obtained at any of the voluntary hospitals

There is at present no provision for convalescent treatment during pregnancy or after confinement anywhere in the county, and it is suggested that one of the old Poor Law institutions might be converted for this purpose Dr Morison also advises that a register be kept of the names of women suitable to act as home helps to the mother during the lying in period As an essential part of the scheme it is laid down that no expectant mother will be eligible for the benefits provided unless she has had an ante natal examination

In cases of puerperal fever and puerperal pyrexia arrangements are already in existence for the provision of a second opinion, for bacteriological investigation, for admission to hospital, and for the attendance of a trained nurse If the practitioner wishes, he can have the opinion of an obstetric consultant from Carlisle, on the request of the medical officer of health Bacteriological investigations are undertaken by the Clinical Research Association, but since this entails some delay the work will be taken over by the pathological department of the Cumberland Infirmary when it is complete These cases are admitted to only six hospitals in the county at present, but the possibility is considered in the scheme that some of the old Poor Law institutions may be utilized for this purpose, emergency nurses are provided by the Cumberland Nursing Association and where necessary the county council bears the whole cost

Provision for Infant Welfare

Under the heading of infant and child welfare, the scheme aims to keep the child under continuous supervision from the time of birth until the supervision of the school medical officer begins The appointment of health visitors in 1918 led to a marked reduction in infant mortality in the years which followed, and the extension of ante natal supervision may be expected to have an equally important effect It is suggested that if the child requires medical treatment for which the parents are unable to pay, then upon the advice of the health visitor, the doctor should be called in, and that he should receive a fee similar to that offered for an ante natal visit Children living within reasonable distance of clinics should attend there for regular supervision, no treatment will be undertaken at the clinics except for minor ailments and for those conditions which would be unlikely to obtain treatment elsewhere, such as eye, ear nose, throat, and cripple cases Arrangements will be made with various voluntary hospitals in the county for the accommodation of surgical and medical conditions requiring institutional treatment which may arise among infants and children Provision of convalescent treatment will be necessary, and the cases of all children reaching the age of 5 years in a state of health which prevents their attendance at school should be investigated in order that medical or surgical help may be provided as required The importance of refresher and post graduate courses for midwives and health visitors is emphasized

The minimum estimated gross expenditure on the scheme exceeds the present annual outlay by nearly £7,000 expenditure stands at present at £4,437, so that the new scheme will cost more than twice as much Modifications of the scheme introduced by the Ministry of Health require that the doctor's fee for each ante natal and post natal visit shall be only 5s *plus* mileage, instead of 10s as proposed, further, that the application of the scheme shall be limited "to those women who engage a midwife for the confinement, and who are not insured persons under the National Health Insurance Act, and who, having regard to considerations of distance and their physical condition, are unable to attend an ante natal clinic" The third point restricts the scheme "to those children who are unable to attend a welfare centre and whose parents cannot afford the necessary treatment"

The scheme will come into operation in November, and will apply to the whole county with the exception of the city of Carlisle and the boroughs of Whitehaven and Workington

RADIUM THERAPY

Chaucer paraphrasing the first aphorism of Old Hippocrates, wrote

> The lyfe so short the craft so long to lerne
> Th assay so hard so sharpe the conquering

It this is still true of the medical art as a whole it applies with peculiar force to radium therapy to-day Almost every recent pronouncement on radium has declared that pending further and more intensive study of the many problems that present themselves, and careful collation of methods and results over several years the efficacy of this powerful agent must remain *sub judice*

The National Radium Trust and the Radium Commission have now rendered an account of their first years stewardship and a summary of their reports will be found elsewhere in this issue The conclusions reached by the Commission are printed in full at page 657 They amount to a guarded and provisional verdict of Not Proven The Commissioners insist once again on the need for great caution in estimating the value and efficacy of radium in the treatment of cancer and deprecate in the strongest terms the kindling of false hopes by means of sensational, or even optimistic statements The best that can be said is that some results, under certain conditions, are very satisfactory, that others, for no clearly established reasons are less so and that in a considerable proportion of cases the results are either inconclusive or definitely disappointing This however does not in their view justify a pessimistic outlook because many problems that yet remain unsolved may yield to experience and research

A good case has been made out for the increased employment of radium A new weapon and a powerful one, has been placed in the hands of the medical profession, though how effective it may be it is impossible, as yet to say Nor is it yet established whether patients with malignant disease should be treated with radium alone or with radium combined with surgery or *x* rays It is probable that a judicious use of all three methods may be required but in any case clinicians must be familiar with them all In these words the Radium Commission summed up the case for radium ' when issuing a preliminary survey of the position eleven months ago [1] The time was ripe for some such authoritative statement with a warning against extravagant claims because there appeared to be a real risk that the dashing of false hopes might bring into discredit a method that seemed full of promise in the treatment of certain forms of cancer All those qualified to give an opinion are now agreed that radium may be extremely dangerous in unskilled hands, and that one primary need of the moment is for an adequate force of radium workers trained in the highest standards of technique in short, that there is to-day more radium in this country than there are people capable of using it It is to be hoped that the courses of instruction at the newly founded National Post Graduate School o Radiotherapy will do much to supply the need

Experts in radium therapy had many opportunities of pooling their views on various aspects of the problem during the Annual Meeting of the British Medical Association at Winnipeg In a debate on the uses of radium in gynæcology [2] the opener remarked on the difficulty of comparing results because of the elastic standard of cure adopted by different centres, and the many divergences in technique and dosage, and Professor Chipman, entering a plea for more knowledge and greater care insisted that radium should only be applied by those specially trained in its properties and effects The Surgical Section held a symposium on the uses of radium in surgery [3] in which each speaker dealt with the region to which he had paid particular attention All who took part seemed to be of one mind about the need for team work between experts on a more comprehensive scale in order that the clinical radium worker may conduct his practice on scientific lines They were agreed too in condemning the view that radium is a panacea for cancer, and in calling for more work in all directions before the value of radium can be assessed The general attitude was summed up by the surgeon who reported this debate for us as one of cautious optimism ' In the Radiological Section, also words of caution were spoken during the discussion on radiation therapy [4] Dr Douglas Quick made the point that while in some malignant conditions radium could be employed with great advantage, in others it was only of value for the treatment of certain phases of the disease Professor Ewing remarked on the fact that some highly sensitive tumours disappeared quickly under radiation by direct killing of cancer cells, but there was a much larger group of resistant tumours which could not be cured by killing cancer cells, except in dangerous doses, and in these cases moderate repeated doses were safer and more efficacious hence, it was important to decide, not only the group to which a particular tumour belonged but also on what principle it should be treated

One thing about which all workers appear to be satisfied is that the most striking and permanently beneficial effects of radium are seen in rodent ulcer and cancer of the skin But in regard to malignant disease generally the Commission states, as its considered opinion that while radium holds out a good promise of beneficial results and certainly of alleviation of suffering it is at present a very dangerous weapon and one which unless used with the greatest skill care and precaution may easily be productive of more harm than good

THE TRAINING OF PUBLIC HEALTH WORKERS

One of the most generally interesting of the Sections at the Winnipeg Meeting of the British Medical Association was that of preventive medicine The first day was devoted to a symposium under the presidency of Dr A S M Macgregor on the development of a well trained public health personnel A summary of the discussion was given in the *Journal* of September 13th last (p 431) and in this week's issue we print some of the opening papers—a general introduction to the subject by Professor J G Fitzgerald of Toronto and others by Dr A Grant Fleming of Montreal Dr D T Fraser of Toronto Dr James Roberts of

Hamilton Ontario, and Dr F C Middleton of Regina At the present time, when the development and organization of the public health services for wider purposes than mere sanitation or even personal, domestic, school, and industrial hygiene is under serious discussion, the consideration of the supply, education, and technical equipment of the personnel of these services is of peculiar importance Though conditions vary in Great Britain and in Canada, the fundamental requirements in both countries are the same, and in these papers important facts are set forth and important suggestions made, with regard to the suitable training of undergraduate medical students, of sanitary inspectors, of nurses, and of home visitors in this connexion Sir Eustace Hill in his remarks, which were not embodied in a formal paper, dealt almost exclusively with the training of midwives, and Dr J W Bone followed these up with a valuable statement on this matter It is curious, indeed, that the subsequent discussion tended to confine itself to the question of midwives and a maternity service, which are not touched upon in the opening papers This was perhaps natural in view of the recent publication of the reports of the departmental committees on maternal mortality and morbidity, and on the training of midwives It is understood that these reports are now receiving the careful attention of the Government, and, as far as the education of the medical student is concerned, of the General Medical Council, and there will no doubt be further opportunity for comment in the early future

The really significant feature of Dr Grant Fleming's paper on undergraduate medical training in public health is the underlying assumption that this training is not to be directed to those who intend to become specialists in the public health services, but to all medical students, on the principle that all medical practitioners, especially general practitioners, must be regarded as in intimate relation with, or even as actual members of, those services That this should become the common assumption, and that practical application should be given to it both in Great Britain and in Canada, are perhaps the most urgent needs in public health matters to day Three things are necessary that wide opportunities should be at once given for private practitioners to take responsible part in the work of public health departments, and especially in that of council hospitals and clinics, that general practitioners should show themselves increasingly willing to devote a portion of their time to such responsibilities and work, and that the education of the medical student should be so guided in the future that this will seem his natural duty, and become a commonplace among his activities For this last purpose two things are required that throughout the medical curriculum, in the teaching of each subject, its preventive aspects should be emphasized, and that during his undergraduate course the student should be familiarized with the actual working and conditions of the various public health activities

The first of these two requirements has now become widely recognized and is being increasingly supplied It is to the permeation of the whole teaching of medicine by stress on the preventive aspect of medicine as opposed to the establishment of 'preventive medicine' as a separate subject of the curriculum that attention is being directed This is as it should be Dr Fleming in his paper admirably asserts this guiding principle, and draws attention also to a very important consideration connected therewith Mental hygiene he says 'is part of preventive medicine The more closely the mental and physical problems are kept together, the better the student will come to understand that he must consider the whole individual, that every individual has a physical and mental side, and that health can only be attained by a proper development of both also that the prevention of physical and mental diseases must be considered on the same basis' The other requirement—that the medical student should be familiarized with the practical working of public health services—has hitherto received quite inadequate attention, though this defect is now being remedied at a number of medical schools In this country the general tendency has been to give such special instruction and establish such practical contacts late in a student's career, even, perhaps, only in the last year thereof In Canada, on the contrary, it would seem that some provision is made for this, even in the first year of medical study, and that year by year thereafter there is provided increasing opportunity for familiarity with public health organization The relative advantages or disadvantages of these two methods are well worthy of consideration In any case it must be borne in mind that "field visits must be made worth while, or they are a waste of time and minimize the importance of the subject under consideration"

The status and the training of sanitary inspectors, of public health nurses, and of health visitors—as of other social workers—are matters of growing concern The paper by Dr Russell Roberts draws attention to very real dangers in connexion with the office of sanitary inspector The importance of his position has scarcely received adequate recognition, though in this country the question whether he should be an official of the health department or of that of the engineer and surveyor, has not seriously been raised There is general agreement that he most usefully belongs to the former His technical training cannot be too thorough, and that of the other health workers mentioned must, of course, be adequate There is one danger, however, of which the tenor of these papers gives some indication Neither university training nor academic distinction or accomplishment should be considered an essential condition in the training of these officers Such training and distinction are, of course, no disqualification, but the spheres of activity of these workers offer exactly those opportunities of service which should be freely open to men and women who, though of good education, have no aptitude for passing examinations or satisfying high scholastic tests, but who possess the qualities of character, the sympathetic insight and wisdom of judgement, which are the most valuable requisites for usefulness and success in these branches of public health work

THE MILK INDUSTRY AND SCIENTIFIC RESEARCH

MILK is still one of the most valuable foods of mankind, and the production of milk is one of the most important branches of agriculture This industry has made greater advances during the past decade than any other one connected with our food supplies In the future, perhaps, the production and sale of milk will become one of the public utility services, and, like water, gas, and electricity, will come under the control of municipal or other authorities Meanwhile it may be recalled that investigations into the production of milk have received the active support of the Ministry of Agriculture, and that two institutes are engaged on its various problems—apart, of course, from the numerous organizations concerned with the study of milk and disease The National Institute for Research in

During the older of the two was established in 1912 at Reading its work has continually developed and extended since the war until the present time when it covers a considerable area of ground its activities comprising all questions relating to the production, handling and distribution of milk and the manufacture of dairy product In the annual report for 1929[1] Professor Stenhouse Williams describes in detail the work of the staff, and the future developments which are contemplated The institute contains three main departments in addition to an experimental dairy The department of dairy husbandry is concerned with such diverse problems as manuring of pasture lands, milking machines, fat records, feeding of calves and milk production Another department investigates the many complex chemical problems associated with milk while the bacteriological department conducts researches in connexion with the various organisms associated with milk and milk products In Scotland the Hannah Dairy Research Institute,[2] which is under the directorship of Professor J P Catheart, has been established to study milk problems There is considerable activity in agricultural research in Scotland, and since the Development Commissioners considered that the milk industry presented problems which were beyond the resources of the Reading institute the south western part of Scotland, with its enormously important dairy industries was selected as a suitable neighbourhood for the establishment of a second organization of the kind The Hannah Institute is located near Ayr in close association with the University of Glasgow Its work is just commencing, but already researches have been started on the quality of the protein requirements of dairy cows, inheritance of milk yield, milk fever, tuberculosis and the utilization of milk residues Investigation into milk and milk production are not confined to the State-aided institutions, however, and many of the milk combines have established laboratories for bacteriological and chemical testing The United Dairies, for example have twenty-one such laboratories, the last of which was opened this summer at Willesden by Sir Andrew Baltour reference was made in the *Journal* of June 21 st (p 1150) to this event and the value of the work undertaken The public is being gradually educated to grasp the importance of clean milk and tubercle-free milk, and to recognize the importance of milk as an instrument in the spread of disease It does not yet realize, however, that milk is one of the best and cheapest foods available—the United States are far ahead of us in this matter nor does it appreciate the enormous loss of milk from faulty breeding feeding production and lack of hygiene—a loss which it of course must bear in the form of increased price The work being done by the two State-aided institutes and by the private laboratories of the milk industry is assisting to decrease this loss and so by increasing the supply to reduce the price At the present moment the class of the population which most urgently requires a good milk is compelled by its high price to purchase a cheaper and inferior grade It may be hoped that the time will soon come when science and the farmer will abolish this anomaly

MODIFICATION OF INCOME TAX LAW

A minor change in income tax law brought about by the Finance Act of this year has not attracted general attention but it will affect a number of medical men sooner or later Certain radical changes have been made in the assessment of profe sional profits affecting the years 1927-28 onwards, and in particular altering the ba is from the average profits of the three previous years to those of the previous year, in connexion with these changes new procedure is laid down for dealing with a succession to a business or practice Previously where A had transferred a practice to B the latter was liable to account for tax on the previous three years' basis, unless he could show that his own earnings had fallen short from some specific cau e since the change That provision has been repealed, and in the case of such a transfer made after April 5th 1928, A and B are dealt with as if the practice had ceased and then been restarted by B The result is that A is chargeable for his last financial year (or the part up to the date of his withdrawal) on the amount of the profits of that period, and the Revenue has the option of revising the assessment of A's penultimate year to bring it into accord with the amount of the profits of that year instead of the then previous year B is chargeable for his first period to the next April 5th on the amount of his earnings for that period, and for the following two financial years has the option of paying on the usual statutory (previous year's) basis or the amount of the earnings of those years respectively It is obvious that cases may occur in which these legislative changes have substantially altered the position, not only as between the Revenue and A and B combined, but also as between the individuals A and B Special provision, however, has been made for those cases—particularly common in the medical profession—which involve the transfer of a share only in a business or practice Briefly, the individuals concerned are allowed to choose whether the partial change in proprietorship shall be ignored—and the previous year's basis therefore continued—or whether the liability shall be dealt with on the basis that the former proprietors terminated and their successors restarted the practice The statute requires the choice to be unanimous and, in the absence of any such notice, the change is ignored for the purpose of computing the gross assessment If, therefore, A and B are in partnership and C enters the firm, either in addition to or instead of one of the former partners, the previous year's basis will still apply unless A, B, and C each notify the inspector of taxes that they require the practice to be dealt with as a new one, as from the date of C's entry into the partnership So far as an outgoing partner is concerned, his choice will depend on the amount of his earnings for the period of two years or less up to the date when his interest in the practice ceased, and consequently, he can usually arrive at a decision as to which alternative will suit him best soon after that date On the other hand, an in-coming partner is in a more difficult position In his case the balance of advantage depend on future and not on past earnings and, obviously, he will wish to defer his choice until he has had a reasonable opportunity of seeing how his profits are likely to work out in the new condition This is precisely where the former statutory rules failed. They required the unanimous choice to be made "within three months after the change took place," which obviously allowed too little opportunity for the in-coming partner to arrive at a considered opinion and then arrange for the concurrence of the others concerned This year's Act has extended the period for giving the necessary notice to twelve months instead of the original three months and now allows an in-coming partner a fair opportunity of weighing up the pros and cons of the situation and to take the necessary steps to obtain the application of the more favourable statutory rule In the past the provision giving this choice has seldom been used the new rule will give it further scope and will convert what has hitherto been a theoretical right into one which may prove to have real practical value

ANTHROPOLOGISTS AT THE WELLCOME MUSEUM

A RECEPTION for the members of the Royal Anthropological Institute and other bodies interested particularly in African races and culture was held at the Wellcome Historical Medical Museum on October 10th, Dr Henry S Wellcome, the museum's founder and director, acting as host After making a tour of the museum, which includes an exposition of the healing arts as practised among primitive peoples, the visitors were addressed by Lord Lugard, formerly Governor-General of Nigeria, and now British member of the Permanent Mandates Commission of the League of Nations The interest which had been shown in *the welfare of subject races during* the past few years, said Lord Lugard, was one of the most remarkable phenomena of the twentieth century, but in reality it had been growing ever since the abolition of the overseas slave trade No doubt this interest was due in large measure to economic causes, the civilized nations recognizing their need of the products of the Tropics, but it had also a strong humanitarian motive The coloured races had now become articulate, and were bound to become more so as their contact with civilization developed It was very necessary to study how the impact of civilization on a primitive race might be made in an evolutionary rather than a revolutionary way Second only to the immediate problem of India, to be the subject of some momentous decisions during the next few months, was the problem of imperial responsibility in the great continent of Africa To attempt to impose British institutions upon African races resulted at best in an artificial veneer acceptable to, and understood by, only a comparatively small minority who had dissociated themselves from their people In his own acquaintance with the lawless savage Lord Lugard had found that in fact tribal organization exercised an effective discipline, and created a strong patriotism for the local community and an unswerving loyalty to the chief Tribalism had its own code of civil and criminal law, and had evolved among other things a system of land tenure He emphasized the need for that first task of the anthropologist, the study of existing institutions among primitive peoples To that end, Dr Wellcome's extremely interesting museum, illustrating the practice of medicine throughout the world from the earliest ages, makes a great contribution Lord Lugard linked it with the ethnological museum in the Lateran Palace at Rome, which showed in contrast the earlier conditions of primitive savagery and the achievements of to-day, thanks to missionary effort on various lines, including educational and medical Such collections conferred great benefits on both the white man and the black, and would assist in solving the problem of race relations in the future Professor J L Myres, president of the Royal Anthropological Institute, also expressed to Dr Wellcome the feelings of gratitude with which anthropologists regarded one of the most stimulating museums in the country It was a museum where the objects themselves were of extraordinary interest, but what gave them their peculiar value was that they were all eloquent in their selection arrangement, and description of the continuity and development of one of the noblest of applied sciences that mankind had at its disposal Other speeches were made by Dr C S Myers, director of the National Institute of Industrial Psychology, Dr H J J Peake vice-president of the Royal Anthropological Institute, and Mr T A Joyce, deputy keeper of the department of ethnography in the British Museum Dr Wellcome in a few sentences in reply, explained how soon after he began collecting the idea of assisting research workers and students took possession of his mind, and he gradually formed a museum which visualized, as a museum should do within its particular sphere, the failures and mistakes as well as the successes of the past

INTERNATIONAL SOCIETY OF ORTHOPAEDIC SURGERY

THE first congress of the International Society of Orthopaedic Surgery was held in Paris on October 2nd, 3rd, and 4th, under the presidency of Sir Robert Jones On the occasion of its foundation in October, 1929, it had been decided that the society should have a limited membership, ten members only being allotted to the United States, Great Britain, France, Germany, and Italy At the congress it was generally felt that the number of representatives from certain of the smaller countries ought to be increased, but on the question of a large expansion of the total membership there were sharp differences of opinion It was eventually decided to authorize a modest increase in the quota from each country for the next congress, which is to be held in London three years hence, with Professor Nove-Josserand of Lyons as president Dr Munk Jansen of Leyden was elected vice-president, in addition to the vice-presidents already holding office—Professor Gocht of Berlin and Professor Putti of Bologna At the opening scientific session of the congress on October 3rd Sir Robert Jones gave his presidential address on "The domain of orthopaedic surgery" This was followed by the chief subject for discussion—the treatment of congenital dislocation of the hip after the age of 15, the official reporters being Professor Kreuz of Berlin, Dr F Dickson of Kansas City (in the absence of Dr F Gaenslen of Milwaukee), Mr H A T Fairbank of London, and Professor Putti Various members took part in the succeeding discussion, all the five official languages of the society being spoken On the second day of the scientific proceedings, the subject was injuries of the wrist-joint, introduced by Dr Albert Mouchet of Paris and Dr Munk Jansen Operations were performed on two mornings by Professor Ombredanne and Dr Mathieu Sir Robert *Jones presided at the official banquet on* October 2nd at the Union Interalliee, and in the single speech of the evening exercised his inimitable charm on all, despite the linguistic difficulties

INDUSTRIAL HEALTH RESEARCH BOARD

THE tenth annual report of the Industrial Health Research Board contains an account of the work done during 1929 [1] The first section discusses problems of general importance to industry, these include heating and ventilation, vision and lighting, sickness and absenteeism, and the physiology and psychology of work Under vision and lighting, the importance, even to those people who possess normal vision, of using special spectacles for very fine work, is further demonstrated On the subject of accident causation, further evidence is adduced to prove that not only are there certain workers who are prone to accident, but that such may be detected by the use of psychological tests Progress is reported in the study of causes underlying the wide variations observed in sickness absenteeism, and the possibility of obtaining evidence of the incidence of sickness in industry and the methods of recording it is being investigated In this connexion reference is made to a study of the incidence of nervous symptoms among worker in various occupations An extensive survey of the physique of men engaged in different industrial occupations is progressing, and a bibliography of the literature on effects of posture is being prepared Under the heading of psychology of work, an account is given of studies on the effects of monotony and repetition, which are being conducted under actual factory conditions The second section of the report describes work that has been done on specific problems submitted by Government departments and industrial associations, including inquiries into sickness among printers and card-room operatives, the causes of absenteeism

[1] H.M. Stationery Office 1930 6d net.

among coal miners and the effects of pit head baths The report on sickness among printers brings out the special liability to illness (including tuberculosis) of compositors in early life and their comparative immunity from illness later, as contrasted with machine printers warehousemen and cutters and leads to the suggestion of instituting medical standards of fitness for the recruitment of compositors, and the possibility of further light being thrown on the tuberculosis rates of machine printers by *obtaining working life histories*" *When the possible* earnings of coal face workers in the collieries investigated fell 32 per cent, the time lost from voluntary absenteeism fell to one-half, and that from sickness to three-fourths An association was found at some collieries between the introduction of pit-head baths and a decline in the time lost from sickness The third section gives a short account of research work in experimental industrial psychology which has been carried out in various universities in order to determine the extent to which acquired skill is transferred from training in an industrial process to the performance of operations which are simple components of that process, the relative effects of concentrated and distributed practice, and the effects of variety and uniformity in work In its final paragraph the Board appeals for wider interest in its work, and for the more widespread adoption by industry of those definite conclusions—offering well-ascertained benefits to operatives—which have emerged from it

TONSILLAR DISEASE AND RHEUMATISM

There is abundant justification on clinical grounds for the inclusion of acute tonsillitis in the rheumatic series Not uncommonly indeed it is the first event in the development of a group of symptoms which would be universally recognized as acute rheumatism Naturally, therefore, inquiries into the etiology of rheumatism have included a survey of the possibilities of tonsillar infection and of the prophylactic value in this respect of removal of the tonsils On the latter point there are differences of opinion Hence there is a special measure of interest in an observation recorded by Dr Dan McKenzie in an address recently delivered to the Laryngological Section of the Royal Society of Medicine The main object of the contribution was to discuss the circumstances in which, with advantage the tonsils can be gradually destroyed by diathermy and incidentally Dr McKenzie remarks that 'in rheumatism from tonsil infection improvement in symptoms is often observed after the first application of the diathermy" and he suggests that this improvement is due to the sterilizing influence of the application on the infected tonsillar areas It is to be hoped that further observations on this point will be recorded

CLIO MEDICA

Under this title Professor E B Krumbhaar of Philadelphia is editing and Paul Hoeber of New York is publishing a series of primers on the history of medicine, which might well be placed on the English market The series consists of handy little volumes of less than a hundred pages each, and they are written to introduce medical men and others to the way in which medicine has become what it now is The first volume to be issued was on the *beginnings of medicine in Egypt and Assyria* by Mr Warren R Dawson, the second, by Sir D Arcy Power, dealt with medicine in the British Isles and the third, by Sir Humphry Rolleston, treats of internal medicine, a term commonly used in other countries for what we call physic Each volume can easily be read in the course of a short railway journey and each should whet the appetite for more Sir D'Arcy Power concerns himself chiefly with the corporate bodies and the methods by which the medical student has been educated, and he adds a bibliography for the benefit of those who wish to go more deeply into the subject Sir Humphry Rolleston covers the whole ground of medicine, from the difficult story of the beginnings to the latest discoveries of the present day All is presented in an orderly fashion and so clearly that it makes pleasant reading even for a layman, whilst to the professional man it is the unfolding of a remarkable panorama *It is, indeed, only a Pisgah sight*, but it should stimulate the growing interest in medical history which, as the recent congress at Rome shows is one of the features of the present age throughout the world

---

The Bradshaw Lecture will be given before the Royal College of Physicians of London on Tuesday November 4th by Dr W L Hume the subject is paroxysmal tachycardia The Mitchell Banks Lecture, on indications for treatment in pulmonary tuberculosis will be given by Dr L S T Burrell on Thursday, November 13th The lectures will be delivered at the College, Pall Mall East S W at 5 p m Members of the medical profession will be admitted on presentation of card

---

At a meeting of the Central Midwives Board for England and Wales, held on October 2nd, Dr John S Fairbairn, consulting obstetric physician and gynaecologist to St *Thomas's Hospital* was *elected chairman* in place of the late Sir Francis Champneys

BRITISH EMPIRE CANCER CAMPAIGN

In the absence of Lord Reading Sir Charles Gordon Watson presided at the quarterly meeting of the Grand Council of the British Empire Cancer Campaign held on October 13th at the new offices at 12 Grosvenor Crescent Hyde Park Corner S W

On the recommendation of the Scientific Advisory Committee a further grant of £150 was made to Dr J C Mottram pathologist at the Radium Institute London, £300 to Mrs. E. K. Dawson M B Ch B of Edinburgh for the continuance of investigations into mammary cancer and £250 to Mr E Nevill Willmer at the Physiological Laboratory, Cambridge University

An application for affiliation from the Natal Radium and Anti Cancer Fund South Africa was acceded to thus completing the representation of the British Empire Cancer Campaign either by way of branches or affiliated bodies in every one of the British Dominions It was also reported that owing to the success attained by the Nottinghamshire Council of the Campaign its work was being extended by associating with the counties of Derby Lincoln Leicester, and Rutland thus forming the East Midland Council and that the Duke of Portland had agreed to act as president of this new combined council

A report was received from the executive committee that the informal conference between the members of the scientific committees of the Campaign and other cancer research workers would take place before the end of the year in order to take stock of the progress effected and to discuss further general lines of research into the cancer problem

The Grand Council was informed that the popular book entitled *The Truth about Cancer* had been finally approved by all the technical committees and will be published by the firm of John Murray at 2s. 6d. a copy The Finance Committee reported that the Campaign had received an intimation that a legacy of over £20 000 would become available shortly for its research into the causes and cure of cancer

---

The date of Mr Justice McCardie's Maudsley Lecture was incorrectly given in our last issue. It will be delivered before the Royal Medico-Psychological Association in the Great Hall of the British Medical Association House, Tavistock Square on Thursday, *November 20th* at 3 o'clock

NATIONAL RADIUM

REPORTS BY TRUST AND COMMISSION

THE first annual reports of the National Radium Trust and the Radium Commission were published together last week as a Blue Book[1] Both bodies were established by Royal Charter on July 25th, 1929 The main functions of the Trust are to take charge of the funds raised by public subscription and voted by Parliament for the provision of radium, and to arrange for the purchase of radium therewith The Commission's duty is to make arrangements for the proper custody, equitable distribution, and full use of the radium purchased by the Trust While the Trust's first report deals with the purchase of radium up to March 31st, 1930 (which is the period covered by the accounts audited in the form prescribed by the Treasury), the Commission's report extends over a period ending August 31st, 1930

NATIONAL RADIUM TRUST

Within a few days of their appointment the trustees met to consider what steps should be taken to begin the purchase of radium with the money at their disposal—namely, £100,000 or more from the *Times* appeal (being part of the Thank-offering Fund for the King's recovery) and £100,000 voted by Parliament After weighing all relevant considerations—price, guarantees as to quality, the practicability of early delivery, and the filling of the radium in containers—the Trust entered into an agreement with the Union Miniere du Haut Katanga for the purchase of 10 grams of radium at 50 dollars (U S A) a milligram, payable at the current rate of exchange on the day of delivery, this has worked out on the average at about £10 5s a milligram The Trust was able to obtain these preferential terms (considerably below the current market price) in consideration of the fact that it was purchasing radium for the formation of a central national stock It was agreed that the National Physical Laboratory's certificate of measurement should be accepted as determining the quantity of radium delivered Under the same agreement the Union Miniere placed at the disposal of the Trust a "bomb" of approximately 4 grams of radium on loan free of charge, for three months, with the option to purchase at the end of that period at the rate of 50 dollars a milligram, this option was exercised in February A small quantity of Cornish radium (186 5 mg) was also bought, for £1,920 On the recommendation of the Radium Commission, steps were taken later to buy 3 grams of radium for the preparation of radon emanation By the end of March, 9 215 grams of radium were in hand, 5 grams had been ordered, and the purchase of 3 grams was under negotiation

The Trust decided not to undertake to purchase for individual institutions until further progress had been made with the purchase of the radium required for the central stock Having regard to the terms of the original appeal in the *Times*, the Trust considered that the money in its hands must be devoted to the purchase of radium with as little delay as possible for the alleviation of sickness, and that no part ought to be devoted to enterprises mainly directed to the exploitation of possible new sources of supply

WORK OF THE RADIUM COMMISSION

As set out in the Charter of Incorporation, the duties of the Radium Commission are

"(*a*) To make arrangements for the proper custody equitable distribution and full use of the radium which may from time to time be the property of the Trust with the object of promoting the treatment of the sick throughout Great Britain and the advancement of knowledge of the best methods of rendering such treatment and of securing due economy in the use of radium for the purposes of such treatment

"(*b*) to consider proposals submitted to them for the use of the radium for the said purposes and to make such arrangements for the supply on loan of the radium or any preparation thereof as are necessary to enable any proposals which they may approve to be put into operation,

"(*c*) to collaborate with the Department of Scientific and Industrial Research on such terms as regards the repayment of any costs incurred by that Department as the Treasury may approve in securing arrangements (i) for the custody of so much of the radium as may from time to time not be on loan, (ii) for the preparation of the radium in a suitable form before its issue on loan and for the subsequent recovery of the radium from the form in which it has been prepared"

The composition of the Radium Commission and of the Trust was stated fully in the *British Medical Journal* of August 17th, 1929 (p 317) The Commissioners, eleven in number, with Viscount Lee of Fareham as chairman, and Mr Comyns Berkeley as vice-chairman, met first on September 26th, 1929, and by the end of August, 1930 twenty full meetings had been held, besides numerous meetings of subcommittees and conferences with other bodies

Lines of Policy

The general policy of the Commission was outlined in our issue of October 5th, 1929 (p 636), and official communications on the present position of the radium problem and on the work of the Commission and its policy appeared on November 16th, 1929 (p 911), and April 12th, 1930 (p 714) The main task to which the Commission addressed itself was that of framing and creating a national organization which should serve, so far as practicable, the needs of Great Britain Its primary objectives were held to be (*a*) "treatment of the sick," as prescribed by the Royal Charter, and (*b*) evaluation of radium in the treatment of cancer as determined by results over a period of years

"To carry out this task in the most effective, safe, and economic manner it was considered imperative that a policy of concentration of radium, as against dissemination, should be adopted and pursued It was therefore decided that the distribution of national radium should be restricted to places possessing a university with a medical school and complete clinical courses and that only one hospital—nominated by the medical faculty of the local university and approved by the Commission—should be recognized as the national radium centre for the area concerned In this way only was it thought practicable for the Commission to retain any effective control over the distribution and use of the radium committed to its charge and experience so far has shown that these initial and basic decisions have been justified by results

'Proceeding on these lines the following geographical distribution of radium at the selected national centres was approved *England* (7 centres)—Birmingham Bristol, Leeds Liverpool Manchester Newcastle on Tyne, Sheffield *Scotland* (4 centres)—Aberdeen, Dundee, Edinburgh, Glasgow *Wales* (1 centre)—Cardiff

"It was concurrently decided to treat London as a separate and special case, and to combine a centre for treatment there with a national post graduate school of radiotherapy for the service of the whole country"

Immediately after the declaration of this policy negotiations were opened with university authorities in all the selected areas In every case the Commission's proposals met with a cordial response, and deputations from the medical faculties concerned were received at the Commission's offices (5, Adelphi Terrace, W C 2) In this way many local difficulties or doubts were resolved, and the procedure was settled in detail for organizing the national centres on a uniform basis with due regard to local circumstances These preliminaries over, the Commission entered into a formal agreement with each centre specifying the conditions under which the national radium allocated was to be loaned and utilized By the end of August some 18 grams of radium had been provisionally allocated to national centres Progress in the organization of these centres has varied much a summary of the present stage of their development is printed as an appendix to the report It is hoped that all the radium allocated will be in full clinical use by the end of this year

Post-Graduate School of Radiotherapy

In the Commission's view the need for a larger number of practitioners, fully qualified to practise radiotherapy is at least as urgent as an increased stock of radium and it has been much impressed by the lack of adequate facilities for the teaching of this all-important subject

[1] Cmd 3758 H M Stationery Office 1930 1s 3d net

One of its first preoccupations, therefore, was the creation of a central National Post-Graduate School of Radiotherapy, and it was decided that this could most appropriately be established in London. It soon became apparent, however, that the scale of equipment and operation of an adequate centre would be beyond the resources of any existing teaching hospital while, on the other hand, it was felt to be undesirable that the new school should have to wait for the establishment of the projected British Post-Graduate Hospital and Medical School at Shepherd's Bush or become absorbed in it.

As already indicated in these columns[2] the Commission decided that the best solution of this problem would be the co-operation and (if practicable) the amalgamation of two existing institutions—the Mount Vernon Hospital at Northwood, Middlesex, and the Radium Institute in Portland Place, London. As a first step the authorities of the two institutions were invited to attend a joint conference in February 1930, and, after two formal meetings, the general scheme drawn up by the Commission was agreed to in principle. Under this arrangement the main clinical and pathological work of the joint institution will be carried out at Mount Vernon, while the diagnostic and out-patient department, with a proportion of the surface therapy work, will be centred at the Radium Institute, which will also become the Commission's principal centre for the supply of radon (radium emanation). The total amount of national radium allocated to the joint centre will be: Mount Vernon Hospital, 3 grams (for clinical work); Radium Institute, 1 gram (for radon). This will be in addition to the existing supplies of the two institutions. The post-graduate school is being formally inaugurated this month, and a comprehensive course of instruction has already been approved and advertised.

Uniform Case Records

It has been the Commission's aim from the first to maintain harmonious relations with other important bodies interested in the medical uses of radium—namely, the Medical Research Council, King Edward's Hospital Fund for London, and the British Empire Cancer Campaign. With this object in view a joint conference was held in December last, followed by frequent consultations and correspondence. A valuable outcome of this co-operation has been the approval and adoption of uniform case records for clinical use, which constitute a first and essential step in the compilation of national statistics of radiotherapy. The forms for entering full particulars of cases, including regional charts and follow-up sheets, are reproduced in an appendix to the Commission's report.

The Westminster "Bomb"

The 4-gram "bomb" originally held on loan and later purchased outright, was acquired in order to enable the Commission to try out the method of 'distance radium therapy" or "mass irradiation," which has been practised for some time past in other countries with undetermined results and which, it proved successful, might in many cases obviate the need for surgical intervention. The Westminster Hospital, chosen by the Commission to undertake this work, had had previous experience with a smaller 1-gram bomb, but the larger apparatus involved new problems of technique, and while it has been continuously in use for the treatment of patients night and day since November, 1929, under the control of a highly experienced team, many problems still remain to be solved. As at present advised the Commission is of opinion that the experience so far gained is not sufficiently encouraging to justify the acquisition of any more large bombs at the present time.

General Conclusion—Judgement Deferred

In conclusion the Commission insists once again that great caution is necessary in estimating the value and efficacy of radium in the treatment of malignant disease, and it cannot too strongly deprecate the creation of false hopes by means of sensational or even optimistic statements.

As a result of world experience, extending now over many years, the best that can be said is that some results, under certain conditions, are very satisfactory, that others, for no clearly established reasons, are less so, and that in a considerable proportion of cases the results are either inconclusive or definitely disappointing. This does not justify a pessimistic outlook, as many problems which yet remain unsolved may yield to experience and research. But time is an essential condition of success, and it can only be after several years of pioneer work that there can be a sufficient supply of statistical and scientific data to enable positive conclusions to be reached and published to the world.

The Commission has therefore made it its first duty to organize a concentrated and controlled national radium service, with a definite and co-ordinated programme, which will be carried out at selected centres under the supervision of recognized experts, and of which the progress and results will be recorded on a uniform system. By this means the treatment of the sick, which is enjoined in the Royal Charter, will *proceed pari passu with the advancement of knowledge of the best methods* of radium therapy, whilst due economy will be secured in the utilization of the limited stock of national radium.

Finally, the Commission feels bound to repeat its warning *that radium is not yet established as a cure for cancer*, that whilst it holds out a good promise of beneficial results and certainly of alleviation of suffering it is at present a very dangerous weapon and one which, unless used with the greatest skill, care and precaution, may easily be productive of more harm than good. This is the Commission's considered opinion as the result of its first year's work, but at least five years of further experience and co-ordinated research will probably be required before any final verdict can be anticipated.

[2] *British Medical Journal*, June 28th, 1930, p. 1155.

THE MINISTER OF HEALTH'S DEPARTMENTAL REVIEW

FORECAST OF A NATIONAL MATERNITY SERVICE

At the annual conference of the Labour Party, held at Llandudno during the week beginning October 6th, Mr ARTHUR GREENWOOD, the Minister of Health, gave a review of departmental legislation. He said that although boards of guardians had disappeared the old Poor Law remained on the Statute Book. What could be done by administration towards the production of a new Poor Law code in harmony with the spirit of the moment was being done by his department. The breaking up of the Poor Law had often been spoken of. The Local Government Act did not break up the Poor Law, but it began to create conditions under which the Poor Law could be broken up, and he hoped that local authorities would pursue as far as they could the policy of breaking up the Poor Law into its component parts. He had tried to do this in connexion with the Mental Treatment Act, a measure misunderstood by many of his friends, but which he considered to be a great new charter in the treatment of mental disease.

Dealing with slum clearance, the Minister said that he attached great importance to a provision in the Housing Act, 1930, which required local authorities to look ahead for five years and to submit a programme for the scrutiny of the Minister. The results of slum clearance schemes up to now had been small, but the new Housing Act provided a code which would enable every bad house in the land to be swept away, and to ensure reasonably decent housing conditions everywhere. Slum clearance, he added, was not half as expensive as the load of disease which bad housing created.

Mr Greenwood then turned to the problem of maternal mortality, which he said was very much in his mind. It was a tragic thing that maternity should be the deadliest of callings that every year three thousand mothers should die in the performance of the greatest of all tasks and responsibilities. More than half—60 per cent. in fact—of maternal deaths were preventable. Moreover, the conditions which led to the deaths of the three thousand might leave their mark for life upon many of the 700,000 who survived. The problem was a baffling one, and so far from the maternity death rate declining, it had actually been increasing. "It is not going to be an easy job to tackle.

The situation is due to many causes I am going to say to the local authorities—and I shall do it very soon—'Parliament has placed in your hands, in the public health responsibilities which you bear, opportunities for dealing with this problem' I *hope* local authorities will do all they can within their power to make the necessary provision for ante-natal treatment, for maternity hospitals, and for post-natal treatment We have, however, to go further than that I think we have to evolve a national maternity service We mean to do that" Immediately the party conference was over the Government would *begin negotiations* with all the people concerned in the problem If the problem was to be dealt with effectively, every form of health provision and health service must be mobilized Local authorities must be consulted also the approved societies and the medical profession, with a view to framing a comprehensive scheme which, combined with the activities of the local authorities, would ensure that no mother should unnecessarily die

On the day Mr Greenwood was speaking at Llandudno, the National Association of Insurance Committees (whose doings are recorded in the *Supplement* this week) met in London and had before it a motion in the name of Cheshire Insurance Committee heartily welcoming the interim report of the Departmental Committee on Maternal Mortality and Morbidity, and supporting the recommendations therein set out, also urging upon the Minister the necessity of taking immediate steps to give effect to them The resolution further contended that in so far as any scheme of maternity service might relate to insured women and the uninsured wives of insured men, such scheme should be administered by and through insurance committees as an extension of medical benefit Another proposal in the same resolution was that the Minister be requested to prepare a short statement of information and instruction on matters affecting maternity for distribution by registrars of marriages to all newly married women The Insurance Committees' Conference followed its usual course with important resolutions, and referred the whole matter to its executive council for consideration

MOTOR CARS FOR 1931.

THE OLYMPIA SHOW

[From our Motoring Correspondent]

(*Continued from page 624*)

A year ago it was thought that the prices of cars had reached their lowest point and that, having regard to the costs of material and labour, it would be impossible to produce them more cheaply Whether it be that the impossible has become a possibility, or whether the various makers are looking for a bigger output to recoup them, one of the most outstanding features of the annual Motor Show which opened on October 16th, is the general all-round reduction in prices While to-day all cars, generally speaking may be relied upon to give satisfactory service, the need for reliable running is of prime importance to doctors inasmuch as their means of conveyance has to be available all the year round and in all weathers Moreover the daily use of cars renders it necessary that not only must the mechanical portions of the vehicle be equal to the task, but that the paintwork and upholstery shall be of a durable, appearance-retaining character Hence, it may be suggested that lowness of first cost ought not to play too important a part in a doctor's choice of car, and that a slightly dearer vehicle may be cheaper in the long run

Four-cylinder Cars still Popular

First word reference was briefly made to the continued popularity of four-cylinder cars As a matter of fact, both the recent Paris Motor Show and the present exhibition show that those who a year or two ago were mournfully sounding the dirge of four-cylinder vehicles were a little too previous On the other hand the position to-day is that not only are there still makers confining their output to cars with four-cylinder engines but there are others who, after having ceased their manufacture for a time, have re-added this type to their programme For the motorist of limited means there is no doubt that four cylinder cars are not only economical in first cost and maintenance, but are capable of rendering useful service At the same time, it is impossible to deny that the six cylinder vehicle has a greater smoothness of running and an undefinable charm about it that gives it a strong appeal to appreciative motorists Indeed, it may be said that "sixes" are likely to form the most popular type of automobile during the coming year, although in the case of cars costing from about £360 upwards vehicles with eight-cylinder engines are being more widely offered and used

Technical Survey

Remembering that motor engineering is no longer a young industry, motor users are beginning to take it for granted that all cars will give efficient and reliable service, and that the various components, from the engine to the back axle, have been both carefully designed and constructed to that end At the same time, there are still large numbers of motorists who take an interest in the progress of engine design and mechanical details For such of our readers who fall into this category it may be of interest to review briefly the tendency of the times Apart from "the battle of the cylinders," already alluded to, it is noted that honours continue to be divided fairly equally between engines with overhead and those with side valves, and that detachable cylinder heads, to facilitate decarbonizing, are now adopted almost universally. Carburettors are being more generally fitted with air cleaner, and, in some instances, a small pump is now being used to supply the fuel to the float-chamber For ignition purposes the coil and battery system continues steadily to replace the magneto formerly employed, the necessary current being supplied by the 6- or 12-volt starting and lighting battery provided on all cars Although the writer has still a preference for the magneto, it may be safely presumed that manufacturers would not, in increasing numbers, adopt a system of ignition other than one which, given the necessary modicum of attention, may be expected to function correctly and regularly It is apparent, too, that battery makers are now turning out more satisfactory accumulators Close supervision, however, is still required, so that motorists generally will be well advised to have their batteries occasionally examined by experts who will see that the cells are kept "topped up" and the terminals clear of corrosion Such attention is especially necessary with doctors' cars owing to the fact that they have, in the course of the day's round, to be started and stopped more frequently than ordinary touring cars, with a consequent greater load on the battery

Improvements in Change-speed Gears

Unit construction of engine and gearbox continues the order of the day, as also do clutches of the plate or disc type Three-speed gearboxes are mainly used on the smaller cars, although on some of these, as on the majority of the bigger vehicles, four-speed gearboxes are now being provided A good deal of attention has in recent years been devoted to the production of quieter change-speed gears, with the result that to-day one hears much of four-speed, silent third boxes, for which it is claimed that the third speed is as quiet in operation as the top direct drive As for the control of gearboxes, it will be found that the centrally located lever is steadily replacing the side change The ordinary hand-controlled sliding-pinion form of gearbox is still mainly employed, it may be mentioned, however, that the mechanically controlled or "self changing" gearbox, introduced two years ago by the Armstrong-Siddeley Company as an optional extra, has apparently not only proved satisfactory in practice but is meeting with users' approval, for it is now being fitted on all the different models of cars produced by the company mentioned The only other departure of note in connexion with clutches and gearboxes is the "fluid flywheel" and semi-automatic change-speed gear, which has been adopted on the Daimler cars Two or three years ago a good deal of interest was shown in the proposal to include a free-wheel in the transmission system of cars to enable them to run very much in the same way as a bicycle Although there is one make of American car in the show

fitted with a free-wheeling device, which is claimed to assist materially in quiet gear changing, the idea does not appear to have found favour with British manufacturers.

Four-wheel brakes are, of course, found nowadays on practically all cars. In the lower priced vehicles these continue to be operated directly by means of rods and levers, but on cars costing £200 and over there is an increasing tendency to employ servo-operated brakes. Shock absorbers are to-day provided in connexion with the springs of motor vehicles, another tendency of the times being an increasing popularity of wire wheels, although it may be noted that, to improve their appearance, large central hub plates are now being fitted.

Servicing Station Facilities

Although among the rank of motorists there are still large numbers of owners who prefer to look after the oiling and greasing of their cars themselves—to facilitate which many manufacturers have either adopted what is known as "one-shot" lubrication, or have arranged the various lubricators in one or more convenient groups—the tendency of the day is to entrust this work to service stations which continue to spring up in all districts, and where such tasks as oil and grease replenishing, piston and cylinder head decarbonization, the grinding in of valves, tyre inflation, etc., can be effected, both correctly and promptly, and at moderate charges, by experts in such work. So important a branch of the motor industry has car maintenance and servicing become that for the first time the Olympia Show embraces a special section devoted to equipment for garages and service stations. If the medical motorist has time to visit this part of the exhibition he will, in all probability, be amazed at the wonderful variety of devices that are now available to facilitate car servicing and "valeting" work.

The Popularity of Saloon Cars

Of motor body types the saloon form remains easily the most popular, offering as it does comfortable accommodation for at least four persons, while as a touring machine for two people it possesses the advantage of enabling luggage to be carried with a minimum of trouble. A type of body that would seem to be meeting with growing approval among those medical men who prefer to drive themselves is the coupe with dickey-seat "boot" at the rear, of which many elegant examples are to be seen. As mentioned last week, sliding or folding sunshine roofs are now being provided by most manufacturers, and though still an extra in many cases, in some instances they are now being furnished without additional charge. One notes, too, that unsplinterable glass for wind screens and windows is now being widely fitted, there being to-day few cars in which this safety provision does not figure in the specification. Although the fabric body is still to be found on many of the stands, it has only met with a limited degree of popularity. What is known as the coach built saloon is the more prevalent type, this having a wood framing with thin sheet metal exterior panelling. The internal finish of cars continues to be improved, and not only are the seats well upholstered, but many conveniences for both drivers and passengers are being provided. Many old established makes of cars continue to appear in a modern garb, the enhanced appearance being due to the adoption of more attractive radiator shapes. The old form of nickel-plated exterior bright parts of cars which, to keep clean, called for the expenditure of much time and labour, has given way to the modern chromium plating. The latter, however, has a new rival in fittings of stainless untarnishable steel, which some makers have adopted.

Cars for Medical Men

As has already been indicated, if there is any particular note about the 1930 show it is the great effort now being made by car manufacturers, not merely to improve their productions, but to offer them at prices which a few years ago would have been regarded as practically impossible. Thus the motor car is brought within reach of a much wider circle of possible buyers. As hitherto it is not easy to single out any particular class of car as being specially suitable for doctors' use. There are those who will find one of the "babies" amply meet their requirements. Others will require more roomy vehicles, and still others, notably those whose practice lies in hilly districts, will need a more powerful vehicle. For these there is available a very wide choice of four- and six-cylinder vehicles, the "sixes" being now offered at prices ranging from £199 upward, with quite a number of productions of about 16-h.p. under £300.

"Baby" cars—infantile in appearance but not in performance—continue one of the outstanding features of the show, and it is interesting to notice how their fame is spreading abroad, the pioneer of the type, the "Austin Seven," being now manufactured under licence in France, Germany and the United States. The class is steadily growing in size, for in addition to the Austin there is now the Morris Minor, the Singer Junior, the Triumph Super-Seven, and an interesting newcomer, the Swift "Cadet." Hitherto the "baby" cars have been limited to engines with four cylinders, but one of the features of the year is the appearance of the Wolseley "Hornet" and the Triumph "Scorpion," both of which have six-cylinder engines.

The Armstrong Siddeley and Austin Cars

The Armstrong Siddeley Company, which is continuing to concentrate on four models of six-cylinder cars—12-h.p., 15-h.p., 20-h.p., and 30-h.p.—have not only been able to introduce many improvements but also to reduce prices. On all models safety glass wind-screens with twin wipers are being fitted, as also finger tip controlled dip and switch lamps and "stop" tail lamp. The 12-h.p. Armstrong-Siddeley, which was one of the pioneers of the modern light "six," is now available at £270, or £25 less than last year, while at the 1930 price it can be fitted with the self-changing three-speed gear, which has proved so successful on the higher-priced models to which it has hitherto only been applied. The 15-h.p. model, which is made in both short and long chassis forms, and with either three or four speeds, has an improved engine, and, like the 20-h.p. and the 30-h.p. cars, is equipped with the automatic change-speed mechanism. The frame has been lowered, while another interesting detail, also found on the two larger models, is a central system of chassis lubrication.

It is a tribute to the satisfaction given to users of their cars that the Austin Motor Company, Ltd. has found it unnecessary to depart from the range on which they have concentrated for several years past—namely, 7-h.p. and 12-h.p. four-cylinder and 16-h.p. and 20-h.p. six-cylinder. The Austin Company introduces improvements as and when they are found possible, and not merely at show-time. The cars to be seen at Olympia this week, however, embody several changes from those displayed last year. The popular "Seven" is, for instance now provided with more roomy bodywork, a larger petrol tank, and more conveniently operated change-speed and brake levers. The old reliable 12-h.p. four-cylinder car remains practically unaltered as regards mechanical details, but, like the 16-h.p. and 20-h.p. vehicles, the bodywork has been improved and given more attractive lines. The 16-h.p. "Six," one of the most popular of the Austin range, has an engine with an eight-bearing crankshaft, a feature also of the 20-h.p. model. One of the most noticeable points of the Austin 1931 programme is the lower prices, all the different types having been reduced.

Hillman and Humber Cars

As is now fairly well known, although the Hillman and Humber companies are in close association, they are carried on as entirely separate undertakings. For next year Hillmans are continuing both the 14-h.p. four-cylinder and 20-h.p. eight-cylinder vehicles the prices of which have been considerably reduced, the saloons being now available at £275 and £355 respectively. Despite the lower prices, various improvements have been effected in the details. Chief interest in the Hillman exhibit, however, centres on a new 20-h.p. straight-eight" to which the name "Vortic" has been given and in which many notable refinements have been incorporated, prominent among these being a new silent-running four speed gear-box controlled by a centrally located lever, servo-operated brakes, lighter steering, and thermostatically controlled radiator shutters.

No car enjoys a higher reputation for reliability than the Humber. For 1931 three models are being produced—

16/50-h.p., and the Snipe and Pullman models. Needless to say, from both the chassis and bodywork points of view, the latest Humber cars are of the highest grade and embody all modern features.

Morris Cars

The Olympia Show would be incomplete without this company's models, and the most striking feature of the 1931 programme is undoubtedly the introduction of a new light six-cylinder vehicle known as the Morris Major, which, in regard to wheelbase, track, and size of bodywork, is identical with the familiar Morris-Cowley. The engine is a neatly designed piece of work, with a bore and stroke of 63.5 × 102 mm., the tax rating being £15. This new model is available at £215 as a fabric "saloonette" with luggage boot at the rear, at £220 as a two-door coupé with folding head and dickey-seat, and at £225 as a folding-head, four-door coach-built saloon. The Morris Minor embodies certain detail improvements, at reduced prices, the fabric saloon now costing £135. A similar remark applies to the well-known Cowley four-cylinder model, the saloon of which has been reduced to £185. Very few changes have been found necessary in the Morris Oxford 15-h.p. "Six," a very popular type. The Oxford is a much more roomy vehicle than the Major, and in its latest form a folding central arm-rest, when raised, enables three persons to be comfortably accommodated on the rear seat. The most powerful of the Morris series of cars, the Isis, which is also available at lower prices, embraces the various improvements embodied in the Cowley, Major, and Oxford vehicles, one of the more important of these, and one that will be appreciated by owner-drivers as well as by professional chauffeurs, being the convenient grouping of the various lubrication nipples. Speaking generally, there is no doubt of the continued up-to-date character and popularity of the Morris vehicles.

Two Notable Coventry Productions

At the new prices, which show drastic reductions from last year, the 1931 cars of the Rover Company, Ltd. should meet with considerable favour. Thus, either as a coach-built or Weymann saloon or as a coupé, the familiar Rover "Ten" four-cylinder car is now available at £189, as against from £255 to £270 last year, and this, notwithstanding the improvements which have been incorporated, and which comprise a wider frame with lower mounted and more roomy body, safety glass wind-screen, electric screen wiper, and luggage grid. Another interesting model which will appeal to many motoring doctors, especially now that its price has been brought under £300, is the Rover two-litre six-cylinder car rated for taxation purposes at 16-h.p. Like its larger sisters—the Light Twenty and the Meteor—the two-litre engine has a four-speed silent-third gearbox. It may be added that all the Rover "Sixes" are available in two grades—the standard and the Regal—the latter for an additional cost having better upholstery and the extra equipment mentioned above in connexion with the Rover "Family Ten."

Many will be interested to learn that there again figures, but in improved form, in the 1931 range of Singer vehicles a 10-h.p. four-cylinder car. Listed at £210, either as a saloon or as a coupé it is a car that may be relied upon to give good service with a moderate cost of upkeep, especially in view of the improved specification, notable items of which are a four-speed gearbox, servo-operated brakes, and springs with shock absorbers. The Singer Junior, which has been reduced in price, now has a four-speed gearbox as well as a larger rear-mounted petrol tank. The bodywork has also been improved and a sliding roof embodied in all closed cars without extra charge. Both the six-cylinder models—the "Six" and the "Super Six"—have also had certain refinements introduced and have been lowered in price.

Next week it is proposed to deal briefly with other cars exhibited and also to mention some of the more interesting motoring accessories shown in the galleries. Readers may be reminded that the show will be open daily from 10 a.m. to 10 p.m. until Saturday, October 25th, and that the charge for admission is 2s. 6d. on Fridays and Saturdays and 5s. on all other days.

C. J. W.

England and Wales.

Vital Statistics for 1929

THE Registrar-General's *Statistical Review of England and Wales for 1929*, Tables, Part II, Civil, may now be obtained from H.M. Stationery Office (price 2s.). As in the previous year, the volume contains statistics of population, marriages and divorces, births, passenger movement, parliamentary and local government electors, and vital statistics of the British Dominions. The population of Great Britain and Ireland, estimated in thousands, was as follows:

	1928.	1929.	Increase + or Decrease − per cent.
England and Wales	39 483	39 607	+0.32
Scotland	4 893	4 884	−0.18
Northern Ireland	1,250	1,250	—
Irish Free State	2 949	2 943	−0.20
Total	48 574	48 684	+0.23

The number of marriages solemnized in England and Wales during the year was 313 316, and was equal to a rate of 15·8 persons married per 1,000 persons living. Both the number and the rate are the highest recorded since 1921. Compared with 1924 the number of marriages celebrated by religious ceremony has decreased from 762 to 743 per 1 000 marriages, while civil marriages, on the same estimate, have increased from 238 to 257. A feature of the returns since the beginning of the present century has been the large number of marriages occurring in the third quarter of the year. During 1929 the number recorded in the July–September quarter was almost double that recorded from January to March. The births registered during the year numbered 643,673, being equivalent to a rate of 16·3 per 1,000 of the population. This is a decrease of 16,594 on the figure of the previous year and a fall of 0·4 in the rate. The number of illegitimate births was 29,307—395 less than in 1928. The proportion of male to 1,000 female births was 1,043, a figure closely approximating to the proportion in recent years and pre-war years. (The maximum was 1,060 in 1919.) The number of parliamentary electors on the register, prepared in respect of the qualifying period of three months ended December 1st, 1928, was 25,095,793, of whom 11,866,794 were males and 13,228,999 females. This is the first register compiled under the provisions of the Representation of the People (Equal Franchise) Act, 1928, and the first in which the number of females has exceeded the number of males. Compared with the previous register the number of male voters has increased by 5·7 per cent., while the extension of the female franchise has resulted in an increase of 53·1 per cent.

Progress of Surgery in Manchester

At the first ordinary meeting of the Manchester Medical Society on October 1st, the president, Mr. J. Howson Ray, gave an address entitled "Thirty years of surgery in Manchester." After referring to his association as a member of the honorary staff with the work of the Salford Royal Hospital, the Royal Manchester Children's Hospital, and for the past twenty-four and a half years with the Manchester Royal Infirmary, he outlined the striking advances made in surgery since 1900, mentioning particularly the progress that had occurred up to the beginning of the war, and the influence of the war on subsequent work. Referring chiefly to the statistical records and reports of the Manchester Royal Infirmary, he indicated many of the changes that had taken place, especially as regards the growth of abdominal surgery, and the improvement in technique and the influence of x rays, surgical diathermy, and radium on the surgical outlook of to-day. By means of lantern slides a series of graphs was shown to illustrate many of the points in the

address, and especially to demonstrate the general increase of surgical work the incidence of types of cases admitted to hospital in the various years was similarly shown In several of the graphs mortality curves were added, revealing the greatly improved results that had been obtained, one graph had been prepared to indicate the yearly admission of cases of diseases of the thyroid gland Commenting on the marked progress in thyroid surgery, the speaker mentioned that he had seen one of the early cases of implantation of sheep's thyroid for myxoedema, and in looking over the records of the Manchester Royal Infirmary he had noticed that in April, 1891, the late Mr G A Wright had performed this operation in the same month and year in which Dr G R Murray had given the first intravenous injection of glycerin extract of sheep's thyroid for a patient, who was a subject of myxoedema, and who lived for twenty-eight years subsequently The speaker announced the figures indicating the number of patients admitted in the successive years from 1900 onwards for acute and chronic appendicitis, chronic and perforated gastric and duodenal ulcers, acute intussusception, lesions of the pancreas, inguinal and femoral hernias (strangulated and non-strangulated), malignant disease of the tongue and floor of the mouth, rectal carcinoma, and cancer of the colon In the course of the address reference was made to the changing character of some of the work in hospital to-day, it was pointed out that the injection treatment of varicose veins had almost entirely removed this class of case from the present-day list of in patients of the Manchester Royal Infirmary

Guild of St. Luke.

The Guild of St Luke will hold its sixty-sixth annual festival service in St Paul's Cathedral on Tuesday, October 21st, at 8 p m , when the Right Rev J E Hine, formerly Bishop of Zanzibar will preach, and the alms will be given to the Royal Medical Benevolent Fund In the course of the service there will be a solemn procession, and it is hoped that as many as possible of those who attend will wear academic dress Ticket holders should be in their seats by 7 45 p m Seats will be reserved for medical practitioners and students, who are specially invited to attend, whether or not they are members of the guild Those wishing to take part in the procession may robe in the Chapel of St Michael and St George The guild was founded in 1864 by medical students, and still desires to appeal particularly to them Membership is also open to medical practitioners who are communicants of the Church of England, clergy being eligible for election as clerical associates The object of the guild is the mutual encouragement and support of its members in leading a Christian life The entrance fee is 1s , and the annual subscription a minimum of 2s 6d Tickets for the service and further information may be obtained from the secretary of the guild, Dr Andrew Currie, 20 Oxford Terrace W 2, or from the secretary of the women's ward, Dr Dorothea Brooks, 65, Park Road, Battersea, S W 11

Provision of Infectious Disease Hospitals.

It will be remembered that by Section 63 of the Local Government Act, 1929, each county council is required "as soon as may be after the commencement of this Act" to make a survey of its area with regard to hospital accommodation for the treatment of infectious disease, provided either by the council of the county itself or by the councils of districts within its boundaries Upon the completion of such survey the council has to prepare a scheme for adequate hospital provision in consultation with the councils of any other county, county borough or district concerned Such scheme has to be submitted to the Minister of Health for approval The Ministry has now issued to county councils (except London) a Memorandum (L G A 40) and accompanying Circular (1145), dealing with the surveys they have to undertake and the schemes they are required to prepare Some county councils have, however, already taken action The Memorandum points out that the necessary hospital provision may be made either under the Public Health Acts under the Isolation Hospitals Acts or under the Local Government Act, 1929 Under these Acts a local authority may itself provide a hospital or may combine with other local authorities to make the necessary provision Various methods by which such combined action may be taken are set out, but it is stated that action under the Isolation Hospitals Acts, 1893 and 1901, has been found to be cumbersome and inconvenient, and that the methods allowed by the Public Health Acts are to be preferred Further, the Ministry states that "experience has shown that a large hospital serving a wide area forms a more satisfactory administrative unit than a number of smaller hospitals serving smaller areas, and with modern means of transport the removal of patients to a hospital situated at some distance from their homes presents little difficulty The county council should consider whether it would be desirable to close any small hospitals found not to be satisfactory, and to enlarge those which are satisfactory in all respects, and can conveniently be extended and made to serve a wider area" It may be added, however, in this connexion, that the convenience of the friends and parents of patients also requires consideration "When the survey has been completed the county medical officer should be instructed to make a report to the council with a view to the preparation of a scheme The Minister desires to call attention to the growing need for the provision of hospital treatment for complicated cases of measles, influenza, pneumonia, whooping-cough, and the acute infectious diseases of the central nervous system" The Minister of Health does not propose to set out any complete model scheme, since the conditions in different counties vary so widely, but certain model clauses are contained in an appendix to the Memorandum, and these will be found of assistance to the medical officers and councils

Chadwick Lectures.

A course of Chadwick public lectures will be held during October, November, and December, illustrated by lantern slides, diagrams, the epidiascope, and films Dr Francis Bach, the Chadwick travelling scholar for 1929–30 and medical registrar of the British Red Cross Society's clinic for rheumatism, will be the speaker at the first of these lectures on Thursday, October 23rd, at 5 15 p m , the place being the Hastings Hall in the House of the British Medical Association The subject of his lecture will be the significance of rheumatism in youth and middle age, and particular reference will be made to the recent British, Continental, and American work as to its causation and prevention Sir William Collins, chairman of the Chadwick Trustees, will preside The two following lectures will also be given in the Hastings Hall, on Thursdays, October 30th and November 6th, at 5 15 p m , the lecturer on the first occasion will be Dr Gerald Slot, physician in-charge of the rheumatism supervisory clinic of the London County Council He will discuss rheumatism in childhood, and comment on its incidence, etiology and symptomatology, mention being made of the work of a supervisory clinic and the treatment of the cardiac child Dr Matthew Ray senior physician at the British Red Cross Society's rheumatism clinic, will be the speaker on November 6th, and will deal with the treatment of rheumatism On Friday November 14th, at 8 15 p m , in the lecture room of the Royal Institute of British Architects 9 Conduit Street, W 1, Mr J H Coste chemist to the London County Council, will discuss the object and methods of sewage treatment particularly in their relation to inland towns and isolated institutions The fifth or this series of lectures will be delivered at Gateshead Town Hall on Friday, December 21st at 7 30 p m by Dr Matthew Ray, on the treatment of rheumatism Sir Robert Philip will deliver the Malcolm Morris Memorial Lecture on Friday, November 28th at 5 30 p m in the lecture room of the Royal Society of Arts John Street Adelphi, W C 2 His subject will be the outlook on tuberculosis with special reference to its changing orientation Sir James Crichton-Browne will take the chair A second lecture on the object and methods of sewage treatment will be delivered by Mr J H Coste, in Reading on a day in December to be subsequently announced Further particulars of these free public lectures—for which no tickets are required—may be obtained from the secretary, Mrs. Aubrey Richardson, 204, Abbey House, Westminster

Surgical Instrument Manufacturers at Dinner

The annual dinner of the Surgical Instrument Manufacturers' Association took place at the Holborn Restaurant on October 10th, and was attended by a very large company of members and their wives and other guests Mr Patrick C Maw was in the chair The toast list was shorter than the musical programme, which was highly entertaining and of excellent quality Mr A W Down, in proposing the health of the association, said that the industry was one in which the members always took a great pride A very long apprenticeship was required, and there was close comradeship between master and man One of the objects of the association was to encourage a high standard of manufacture and he thought he could say that no instruments had so fine a name throughout the world as those which came from the workshops of this country The chairman, in responding to the toast, said that the trade did its best to keep up the high quality of its manufactures, but naturally there was keen competition from foreign firms whom at times it was difficult to beat He made a plea for some measure of protection to be given to the industry In responding to the toast of "The Guests," which was given by Colonel A Young, Sir Holburt Waring said he had always received the greatest kindness and help from the instrument firms with whom he had dealings He was glad to learn that a long apprenticeship was the rule in the trade, and he hoped it would continue It had been stated that the trade was desirous of some form of protection Certainly the curse of the present time in connexion with any highly technical branch of industry was that it should be flooded with machine-made material Sir Holburt Waring mentioned that lately he had been much interested in the provision of equipment of surgical and other appliances for a new block at St Bartholomew's Hospital, and in such matters one ought to be satisfied only with the very best One of the provisions laid down was that the authorities should avoid, so far as possible, certain appliances made of glass or containing a portion of glass for the hospital theatres It was difficult to carry out the specification, but one of the surgical instrument firms came to the rescue and carefully worked out the ideas put before them, and the success they had made of it did great credit to the manufacturers Recently, he had visited an international exhibition of surgical appliances in Dresden, and he regretted that this country was not better represented, while a good display was made from Soviet Russia In future he hoped that the trade would not hesitate to learn as much as possible from other parts of the world Manufacturers should travel abroad and see what other people did Mr I Ferris Scott, Financial Secretary and Business Manager of the British Medical Association, also responded to the toast remarking that he had heard that those representing certain large interests abroad were so convinced that there would be some measure of protection in this country before very long that they had it in mind to open factories here, presumably for the mass production of medical and surgical appliances

Scotland.

Royal Faculty of Physicians and Surgeons

Admission of Honorary Fellows

An interesting event at the monthly meeting of the Royal Faculty of Physicians and Surgeons of Glasgow on October 6th was the admission of four highly distinguished members of the medical profession as Honorary Fellows of Faculty, an honour sparingly conferred, and then only on men of the highest eminence in the profession Three were present to receive the honour—namely Dr Robert Muir professor of pathology in Glasgow University Dr W L Reid eminent in the domain of obstetrics and gynaecology but now enjoying well-earned retirement and Lieut-Colonel L A Waddell C B I M S (ret.) The fourth Honorary Fellow, who was elected in absentia was Professor Karl Friedrich Wenckebach of Vienna who researches into various conditions of the heart especially its irregularities have given him an international reputation, and who is recognized as one of the most accomplished of modern physicians Welcoming Professor Robert Muir, the President of Faculty (Dr John F Fergus) referred to the outstanding position in pathology and bacteriology which Professor Muir occupied his books on these subjects were standard works, which were universally acclaimed as authoritative and masterly As a teacher he had been no less successful, and had earned the admiration and affection of many generations of students, he had brought a lustre and prestige on his own subjects to the Medical School of Glasgow, of which not only the University, but also the Faculty and the whole medical profession were justly proud Dr Fergus further referred to the large number of Professor Muir's old students and assistants who had been called to fill chairs of pathology, not only in this country, but also in lands beyond the seas He emphasized the loyal and generous support which Professor Muir had always given them in their applications for these positions The president, in concluding his remarks, mentioned the recent distinction conferred on Professor Muir by the award to him of a Royal Society Medal, he considered that the Faculty had but paid honour where honour was justly due in following the example of that society in conferring its Honorary Fellowship Admitting Dr W L Reid, the president referred to the high position the new Fellow had occupied in obstetrics and gynaecology, in the scientific development of which he had rightly been hailed as a pioneer By his teaching and his example he had done much to raise the school of obstetrics and gynaecology in Glasgow to the high position it at present occupied By his skill, and by the simplicity and integrity of his character, he had gained the confidence of a large circle of patients, who regarded him as a trusted and able adviser, and also of medical men, who found in him a helpful and loyal colleague Though he had attained a venerable, but a serenely happy and even sprightly, old age, the president hoped that Dr Reid might be spared for many years yet to enjoy life, and not least, that Honorary Fellowship which the Faculty, of which he had formerly been president, had that day conferred upon him The president remarked that Lieut.-Colonel Waddell, as an officer in the Indian Medical Service, had rendered distinguished service to his Sovereign and to his country, he had taken a notable part in many episodes of Indian warfare for which he had rightly been awarded many medals and decorations, including the C B He had also shown high administrative and academic qualities, having been professor of pathology in the Medical College, Calcutta, for several years, and had also held the post of deputy sanitary commissioner for ten years, while his writings on medical jurisprudence in India and his researches on serpent venom were well known But though he had thus proved himself to be "distinguished in the profession," which was the sign manual of those admitted to the Honorary Fellowship, Colonel Waddell had also attained a world-wide celebrity in the domains of archaeology and ethnology, and was a recognized authority on all that pertained to ancient myths and fables, his latest work, *The British Edda*, being a remarkably interesting work on highly original lines The president hoped that, though Colonel Waddell had received innumerable honours and distinctions, he would nevertheless find the Honorary Fellowship of the Faculty, which had been spontaneously and cordially conferred upon him by his professional brethren, one which would yield him pleasure In admitting Professor Wenckebach *in absentia* the president expressed the regret felt by the Faculty that so distinguished a man was not able to be present in person to have the Honorary Fellowship conferred upon him A native of Holland, a geographically small but scientifically great country, and with the traditions of the famous University of Leyden and celebrated teachers like the great Boerhaave to inspire him, Professor Wenckebach, after filling many important positions in Germany had been called to the chair of internal medicine in Vienna, where he had achieved a reputation, not only as a cardiologist but also as an accomplished physician, which had become world-wide Already an Honorary Fellow of the Royal College of Physicians of London, and a recently created LL D of Edinburgh University, Professor Wenckebach was one whom

the Faculty delighted to welcome to its Honorary Fellowship a distinction which in his case, as in the cases of the other new Fellows, had been awarded by the unanimous vote of the Fellows of Faculty

St Andrews University Graduation

Under the presidency of Principal Sir James Irvine, a graduation ceremony was held in the old Parliament Hall at St Andrews University on October 10th, when over forty students graduated The honorary degree of doctor of laws was conferred at the same time on John Alexander Campbell Kynoch M B, C M I R C S, F R C P professor emeritus of midwifery at St Andrews University In presenting him for the degree Professor Blyth Webster remarked that when Professor Kynoch retired in 1928, he had been professor of midwifery for thirty years having filled the chair since its establishment The senatus in accepting his resignation, had minuted its testimony that his long professional life had been marked by unostentatious service of the public weal and conduct at all points in accordance with the best traditions and distinctive character of medical ethics '

Students Hall of Residence at St. Andrews

With the opening of the present term a hall of residence for men students has been established at St Andrews University The new St Salvator's Hall stands to the north of the Younger Graduation Hall and is built in three wings each of four stories, in a Scottish architectural style There is a common room and a dining hall with dais and high table each student is provided with a combined sitting room and bedroom The hall has been erected out of a gift of £100,000 which was sent in 1927 by Mr Edward S Harkness of New York to the University of St Andrews in order to develop collegiate life in this university The same donor recently presented to Great Britain a sum of approximately £2,000,000 to be devoted by five trustees to charitable purposes in recognition of the manner in which Great Britain has borne her burden since the war, when she spent her resources freely in the common cause It may be recalled that he also provided the funds for the Commonwealth Fund Scholarships, by means of which thirty British graduates are sent every year to the United States in order to spend two years of study and travel under generous conditions Under the present scheme of St Salvator's Hall at St Andrews some £40 000 is to be devoted to providing residential scholarships and the holders of these will be required to live in Hall The scheme aims at reviving the mediæval system that prevailed in St Andrews University where some other attempts have already been made not always with success to establish residential halls The women students at this university already have a residence in University Hall which was built at the end of last century it has proved so popular that it has several times been expanded The old system of regents has been revived Each scholar or any other student who desires it will be attached to a regent—a member of the staff—who will act as a guide and adviser to him unlike the tutors of the English universities, however he will not supervise his student work

Inverness Maternity Home.

The annual meeting of the Ida Merry Maternity Home Inverness, was held on October 8th, under the presidency of Mrs Grant of Knockie The Hon Mrs Merry, honorary treasurer, stated that although the financial position was sound, funds were required to provide a more commodious building in view of the steadily increasing number of mothers coming to the home for treatment Miss Owen of the Seaforth Highlander Maternity Home at Fort George gave an account of the value of maternity homes in the Highlands Seventeen years ago a maternity home had been opened at Fort George since then hundreds of mothers and babies had passed through it The president remarked that the personal touch was an important factor in such homes and could never be supplied if they became part of a State organization

Correspondence.

AVERTIN ANAESTHESIA

Sir,—The picture of the present position of avertin anaesthesia painted by Dr Parsons at the Annual Meeting at Winnipeg (*British Medical Journal*, October 4th) is sombre and disappointing, it is not a true representation of the facts as I see them, and gives me almost the impression of having been painted not from the living model, but from a collection of figures

The statistics of the death rate intrinsic to avertin quoted from Lundy, which "might conceivably be reduced considerably in the future" (*Journal* September 27th, p 527), are derived from a study of the first 30 000 cases There can be little doubt that this hope has been or will be realized, for it is known now that the doses originally recommended were excessive and that the substitution of fluid for solid avertin has introduced into the technique a drug—namely, amylene hydrate—which has a stimulating action upon the respiratory centre The natural deduction from these facts would seem to be that it is premature to draw any comparison between the death rates of ether chloroform and avertin Further, in any future attempt to estimate the death rate of avertin account must be taken of the part played by morphine or other preliminary sedative in increasing the depression of respiration caused by avertin It is quite astonishing to find that few writers draw a distinction between avertin anaesthesia and the anaesthesia produced by a combination of avertin and, for example morphine The difference is always obvious, may be great, and should never be forgotten In any inquiry into a fatality which has been attributed to avertin, not only should the dose given be ascertained but also the question asked whether a preliminary sedative had been administered In two at least of the recorded fatalities large doses of morphine or omnopon had been given It is in my experience inadvisable to use morphine unless the indications are unmistakable

It is difficult to agree with the statement that avertin anaesthesia is followed by prolonged coma or a deep sleep from which the patient can be roused with difficulty this is so contrary to my experience (*Proc Roy Soc Med* 1929 xxiii) that I feel sure that Dr Parsons can offer an explanation of this alarming description And in conclusion I hope that he will not hesitate in the future to use avertin when there is serious pulmonary disease in combination with local anaesthesia or gas and oxygen it seems to be the ideal anaesthetic—I am etc

London N W 1 Oct 11th FRANCIS E SHIPWAY

SALINE INJECTIONS FOR HAEMORRHAGE

Sir,—The interim report of the Departmental Committee on Maternal Mortality and Morbidity makes stimulating reading for general practitioners The Committee are satisfied they say (p 109), 'that there is need for an improved practice of midwifery" Admitting this, we must strive to keep abreast of modern standards The report itself shows how easy it is to fall a little below them On page 19, speaking of ninety two cases of post-partum haemorrhage the Committee say ' in only a small proportion was subcutaneous, intravenous or rectal saline used" Again, on page 109, the comparative rarity with which intravenous or subcutaneous injection of saline, or even its introduction per rectum was given in ante partum or post-partum haemorrhage has amongst other things, impressed the Committee with a need for a higher standard of knowledge and skill on the part of the medical practitioner on the spot

Are not the Committee themselves a little in the same case in this important detail—a little below the level of present knowledge? They speak of saline and must I think mean by that the ordinary normal saline (80 grains to the pint) That is appropriate they rightly imply, for subcutaneous use because unless shock has already put the capillaries out of action saline can be absorbed into the blood stream from the cellular tissues But saline is not appropriate, as they imply it is for intravenous use for, being a crystalloid solution it reduces the colloid

concentration of the blood The fluid quickly leaves the circulation by permeating through the vessel walls After a transitory improvement the patient relapses, and her last state may be worse than the first

Of course, the Committee must know all about Bayliss's gum saline (6 per cent gum acacia in 0 9 per cent saline) Being of the same viscosity and colloid and crystalloid concentration as blood, this fluid will stay in the vessels when given intravenously, this is common knowledge The patient has lost blood It is volume that is wanted Here is a means of restoring volume far more available than blood transfusion Why did not the Committee say so, instead of implying their approval of useless and perhaps detrimental intravenous saline?

Again, the Committee speak of saline per rectum Is it not the case that plain water is better—better because its osmotic pressure is lower, and it is therefore quicker absorbed? (See Mr Norman Dott in Fraser's *Surgery of Childhood*, in an excellent chapter on all these matters see also the *British Pharmaceutical Codex* on sodium chloride)—I am, etc,

Holmes Chapel, Cheshire, Oct 12th LIONEL JAS PICTON

CONGENITAL RADIO-ULNAR SYNOSTOSIS

SIR,—I was much interested in a paper on this subject by Mr D J Davies (*Journal*, October 4th, p 557) Such a careful description naturally excites comment

I am sure that by this time Mr Davies will have revised his opinion that the condition is "exceedingly rare," for he saw the first case in July, 1929, and the second appeared no later than May, 1930 In my short experience the cases are commoner still, I have seen at least ten, and have recent records of six Of these six three were bilateral, and all these were instances of Mr Davies's Type 2, three were unilateral, and one of these was Type 2, in which the radius seems to sprout from the upper end of the ulna The other two unilateral cases were examples of Type 1, in which the articular surfaces of the radius and ulna are separate, but the bones are fused for an inch or so immediately below These are the only types I recognize, and are the only two I can find in the literature

It follows that Mr Davies's Type 3 is new, this is extremely interesting if we can be sure that he is not confusing separate entities He writes "The head of the radius is well developed, but it is displaced backwards or forwards", and that "this condition is usually unilateral, and associated with syndactilism, supernumerary thumb, or even absence of thumb" He then describes a case which he allocates to this third group, but it is bilateral and there are no supernumerary thumbs, nor, on the other hand, is the girl lacking in thumbs Her forearms apparently are held in a position of semi-pronation, and "*pronation could be carried out to about 90 degrees*" (the italics are mine) What does that mean? Probably it means *through* 90 degrees, at any rate they can be rotated through an appreciable angle This, in my opinion, completely precludes the possibility of the existence of a radio-ulnar synostosis In the presence of actual fusion one can at the most obtain a little movement through about one or two degrees, due to "rocking" of the great sigmoid cavity on the trochlea

Further in the paper it is stated that the elbows could not be fully extended such is not so in cases of radio-ulnar synostosis in which flexion and extension are unimpaired But in cases of congenital dislocation of the head of the radius extension is limited, and not flexion also the forearm in these cases is held in a position of semi-pronation and rotation is possible through varying angles The dislocation, moreover, may be forwards or backwards, and the head of the radius is altered in shape, just as the heads of the radii in Mr Davies's prints are altered in shape His line drawings would pass very well for drawings of congenital dislocation of the head of the radius In fact, the clinical and radiological evidence he adduces strongly suggests that the case is one of bilateral congenital dislocation of the head of the radius His second case is undoubtedly one of congenital radio-ulnar synostosis, and when ossification is complete will be found to fall into Group 1—I am etc,

Liverpool, Oct 8th BRYAN McFARLAND

EARLY DIAGNOSIS OF INFECTIVE LATERAL SINUS THROMBOSIS

SIR,—In Mr Muecke's paper, read before the Section of Laryngology and Otology at the recent British Medical Association meeting in Winnipeg, and published in the *Journal* of September 20th (p 465), stress was laid upon the fact that the early diagnosis of lateral sinus thrombosis can only be made on purely clinical grounds This encourages me to direct attention to a sign which occurs occasionally in the presence of lateral sinus thrombosis, and which I have noted three times during the past two years

The sign consists of a homolateral hemipallor of the face, with no cyanosis and no oedema The hemipallor is definitely limited by the mid-line of the face and by the outline of the lower jaw, and does not affect the neck In these cases the pallor remained from the time of admission to hospital until anaesthesia (ether) was administered for the mastoid operation, an interval of about two hours The sign appears to occur with sufficient frequency to be noteworthy, if confirmed by otologists and other observers it should prove of use in establishing a diagnosis of lateral sinus thrombosis It is necessary that the general examination of such cases should be carried out in daylight or in a situation where shadows can be excluded—I am, etc,

Glasgow, Oct 11th D RITCHIE PATERSON, F R C S Ed, D L O

HYOSCINE—SCOPOLAMINE

SIR,—In the *Journal* of October 4th (p 550) Dame Louse McIlroy states "Hyoscine is sometimes substituted for scopolamine, but it tends to prolong labour and to cause post-partum haemorrhage" Hyoscine and scopolamine are two names for the same drug, which was discovered independently by two workers, one in England and the other in Germany It was not for some time that it was satisfactorily established that they had both isolated the same principle Considerable difficulty was experienced in making a stable preparation of scopolamine, the early and unsatisfactory products gave variable results, and tended to perpetuate the belief that the two names represented two separate entities I feel sure that Professor McIlroy would be the last person to wish that any erroneous ideas about scopolamine should still linger, for it is to my mind the most valuable drug we possess for reducing the pains of childbirth I have given it as a routine to hundreds of patients, and have never seen any harm come to the baby In conclusion, I would like to point out that this widely held belief of the different action of scopolamine and hyoscine is one more example of the fact that the clinical assay of a drug is liable to be prejudiced—I am, etc,

London, W 1, Oct 11th G W THOMALD

NECROPSIES BY GENERAL PRACTITIONERS

SIR,—In your issue of October 4th (p 582) this matter is approached by Lieut-Colonel Henry Smith It is gratifying to read of Colonel Smith's success, and one could not expect otherwise after the vast field of medicine and surgery in all its special branches that he says he has covered

I have been a police surgeon for some years, and where the case is one of supposed murder or of any other great importance I have usually sought the assistance of a Home Office expert For such work to be placed in the hands of a county council medical officer, as Colonel Smith suggests, is only a step worse than in the hands of the general practitioner, for these officers are simply administrators of school medical officers or medical officers of health with little all-round practical knowledge of medicine and surgery Besides which it would be taking from the general practitioner a little more work beyond what he has already been robbed of

As far as I am aware, students are still taught medical jurisprudence and forensic medicine sufficiently to guide them through most cases, and also to know when and in which cases to seek the assistance of a Home Office expert For my own part I have always been at ease in the witness-box—I am, etc,

Chichester, Oct 5th ARTHUR M BARLOW

UNNECESSARY NECROPSIES

SIR,—Opening out of the discussion on the performance of necropsies which has been proceeding in the *Journal* there are two other questions connected with coroners' courts which I should like to mention: they are the holding of inquests in the case of deaths under anaesthetics, and in deaths of aged persons suffering from chronic complaints.

I believe I am right in saying that when information reaches a coroner of a death under an anaesthetic he is bound to conduct an inquiry. I would suggest that instead of this hard and fast rule the matter should be in his discretion to decide whether to hold one or not. When anaesthetics were first introduced there might have been some justification for compulsory inquests, but surely medical art has advanced beyond that stage, and there is now no longer the smallest novelty in the fact of general anaesthesia.

One of the reasons for such inquests *no doubt*, is to ensure that anaesthetics should not be given carelessly, or by those without the necessary experience. In such cases the coroner would generally have sufficient information to enable him to decide that an inquest was desirable, and he would hold one. But there are numbers of other cases where an anaesthetic is administered by a man with expert knowledge, where the gravity of the operation has been *fully canvassed beforehand by the surgeon and medical* attendant, and where the patient or his representatives are entirely alive to the risks about to be run, and agree to run them. The case is a desperate one, but the patient will die unless some operation is performed which may save his life. He rightly decides to take his only chance. In not a few of these formidable cases a fatal termination is the result. Now what is to be gained by an inquest here? Nothing that I can see. But on the other hand, a great deal of hardship may easily be inflicted on all concerned—distress to the relatives, loss of prestige to the anaesthetist and doctors, and useless expense.

Is it fair that a man who accedes to a brother practitioner's request, as many of us have done, to give an anaesthetic in some critical case of, say, abdominal obstruction, should have the nightmare of a sort of public court-martial hanging over his head because he is good enough to do his utmost to help to save the patient's life? He has enough to think about without this further anxiety. He should have the quiet satisfaction of knowing that doing his best in such circumstances will earn him whatever the result the gratitude he deserves for his courage, and not a possible compulsory appearance in a public court.

With regard to the deaths of aged persons, I think that a real hardship is often inflicted by the coroner insisting on *an inquest where some old patient who is known to be* suffering with cardiac or other serious ailment dies without having recently consulted a medical man. There are many such people who live their lives in comparative comfort until the clock running down, they are found one morning dead in bed. Their doctor knows perfectly well that such an event is to be expected, but unless he has actually attended them within the last month (the usual term) an inquest is insisted upon. Surely, in these cases if the doctor, knowing the family circumstances, is satisfied as to the natural cause of the death the coroner might with safety extend that month to something more like a year. I do not quite see why one year should not be considered an equally safe limit for all practical purposes.—I am, etc.,

Sanderstead, Surrey, Oct. 8th. H. D. EVERINGTON.

DIATHERMY TREATMENT OF TONSILS

SIR,—In view of the recent controversy appearing in the *Journal* over the claims of x rays and ultra-violet light in the treatment of septic tonsils I read with no little interest the letter from Dr. Penn in your issue of October 4th (p. 581). With a combined treatment of x rays, ultra-violet light and vaccine therapy administered as often as twice weekly for two or three months, he found some cases to resist all treatment while others returned with a recurrent infection "as bad as they were originally." This poor result he contrasts with the excellent one obtained by diathermy. This has been my experience for some years, and I am glad that he stresses the additional advantage of *being able to treat patients* "with weak heart." Dr. Penn mentions a Schall machine; any really good diathermy apparatus will do. I do not however, allow my patients to carry on with their daily work, but prefer them to remain in bed for a day or two[1].—I am, etc.,

Putney Hill, S.W., 15 Oct. 6th. WYNNE COLLINS.

Obituary

JAMES PAUL BUSH, C.M.G., C.B.E., Cr.M.,

Consulting Surgeon, Bristol Royal Infirmary.

THE lamented death of Colonel Paul Bush, on October 7th, at Clifton, has robbed Bristol of an outstanding representative of its old medical school.

James Paul Bush was born at Brislington, near Bristol, in 1857, and was educated at Clifton College. He studied medicine at the Bristol Medical School shortly before the University College was founded, and his clinical work was carried out at the Bristol Royal Infirmary and at University College Hospital, London. At the Bristol Royal Infirmary he gained the gold medals for medicine and surgery. He obtained the diplomas M.R.C.S. in 1881 and the L.S.A. *in 1882, and in 1912 the honorary degree of Ch.M. in the* University of Bristol. He held a succession of resident posts at the Infirmary, concluding with that of senior resident medical officer, which office he resigned in 1885 to take up the appointment of assistant surgeon. In 1889 he was appointed surgeon to the Infirmary, ultimately retiring from the active staff in 1913 when he reached the age limit and was appointed consulting surgeon. Paul Bush served the Infirmary with exemplary diligence and loyalty, his punctuality being proverbial. Although not a wide reader, he kept abreast of surgical progress, he learned new technique quickly, and was a skilful operator whose judgement, experience, and practicability were esteemed highly. But while he was receptive of new procedures in the art and craft of surgery, he was always opposed to the diversion of the profession into specialties. *It would not be unfair to say that he regarded general* surgeons as belonging to the parent stem and specialists as being noxious weeds or fungus outgrowth. His honesty of purpose however, prevented his opinions from affecting his personal friendship for those of his colleagues who held other views on one occasion he said: "We don't fall out with each other on the Infirmary staff because we can call each other damned fools to our faces at faculty meetings."

As a student he had been a leader in athletics, and captained the Bristol medical cricket and Rugby football teams at their zenith. The Volunteer movement always interested him keenly, and for some years he was surgeon to the Bristol Rifles, a battalion which his father had commanded. In 1900 he volunteered for service in South Africa: he went to Natal as senior surgeon to the Princess Christian Hospital, also acting as P.M.O. of the hospital ship *Le Marc Castle*. For his services in the South African war he received the two medals with several bars, and was invested with the C.M.G. by King Edward at Windsor Castle. On the establishment of the Territorial Force in 1908 Bush was designated to command the 2nd Southern General Hospital, to be formed in Bristol should war break out. His administrative foresight and energy were so great that on mobilization in 1914 a 520 bed hospital was immediately opened housed partly in the King Edward Memorial wing of the Royal Infirmary and partly in the newly built, but so far unoccupied, Poor Law hospital at Southmead. The result was that until many of the general hospitals of the Territorial Force which were extemporized at the outbreak of war Bristol could offer forthwith buildings and equipment which represented the most modern ideas in surgery and medicine. He directed the hospital with marked ability, winning the warmest approbation from Sir Alfred Keogh. There were occasions, however, when his jovial disregard for red tape surprised Whitehall into a king first, what he meant by his contempt of regulations, and then standardizing his innovations

[1] Destruction of Tonsils by Diathermy. *British Medical Journal*, June 14th, 1930, p. 1064.

throughout the civilian war hospitals of the country Among the most valuable of his innovations must be mentioned the "information bureau" which he formed at the 2nd Southern Hospital, and which was often the sole channel by which the War Office itself would trace the whereabouts of the wounded in this country In 1917 he proceeded to Etaples in command of No 56 General Hospital, the constant bombing to which the hospital camps were subjected left its mark on him during the rest of his life In August, 1918, he returned from Etaples to become A D M S of No 2 Area, Southern Command, an area which comprised all the hospitals in Gloucestershire, Somersetshire, and part of Wiltshire At the end of the war his services were rewarded with the C B E, and he retired with the rank of colonel The King of the Belgians appointed him an Officer of the Crown of Belgium, and he became a deputy-lieutenant for the county of Gloucester

Among his other activities Bush had held the post of chief surgeon to the Bristol Police, surgeon to the Bristol Post Office, and consulting surgeon to the Almondsbury Memorial Hospital and to the Pontypool Hospital In University College, Bristol, he was lecturer on operative surgery for many years, and a member of the college council When the University was founded he was one of the first recipients of honorary degrees—that of Ch M He was a member of council of the International Surgical Society, president of the Bath and Bristol Branch of the British Medical Association, successively secretary and president of the Bristol Medico-Chirurgical Society, and a vice-president and member of council of Epsom College His devotion to this school was intense, and his unremitting efforts as local secretary were rewarded by his returning year by year an ever-growing list of subscribers, even during the long and painful illness which preceded his death his interest in Epsom College never flagged

A colleague writes Paul Bush was a man of wide interests, endowed with great energy, thorough and enthusiastic in all his undertakings, and a warm-hearted friend In the Bristol Medical School he will long be remembered, even in his lifetime he had become one of the traditional characters of infirmary anecdote ranking therein with "Dick" Smith and Greig Smith themselves He leaves a widow, a son, and a daughter, with whom deep sympathy is felt

R C B MAUNSELL, M B, B Ch, F R C S I,

Surgeon Mercer's Hospital, Dublin Past President, Royal College of Surgeons in Ireland

The medical profession in Ireland has sustained a severe loss by the unexpected death, on October 10th, of Mr R C Butler Maunsell, while on his return journey from Paris where he had left his only daughter at school

Robert Charles Butler Maunsell was born in November, 1872 the son of Mr Robert Maunsell of Ballinasloe, co Galway He received his early education in the High School Dublin and subsequently entered Dublin University as a medical student, where, in 1894, he graduated M B, B Ch B A O His first appointment was resident surgeon in Sir Patrick Dun's Hospital, after leaving this institution he was appointed in 1898 visiting surgeon and lecturer in clinical surgery to Mercer's Hospital, Dublin, posts which he held until the time of his death In 1900 he obtained the diploma of Fellowship of the Royal College of Surgeons Ireland, in 1904 he was elected a member of its council, he became vice-president in 1922, and was president from 1924 to 1926 During his presidency the Free State Government decided to establish a separate *Medical Register* At this crisis Mr Maunsell devoted much of his time and energy to devising a solution of the difficulties entailed which would be acceptable to both the British and the Irish Governments, it was his scheme, with very little alteration, that was finally adopted He was subsequently elected to represent the Royal College of Surgeons on the first Medical Council of the Irish Free State He was also a Fellow of the Royal Academy of Medicine in Ireland and a member of the council of the Surgical Section Fellow of the Association of Surgeons of Great Britain and Ireland, and president of the Dublin University Biological Association Among his contributions to surgical literature were "Carcinoma of the rectum, complicated by pregnancy and treated by excision" (*British Medical Journal*, 1925), "Surgical treatment of abdominal aneurysm" (*Transactions of the Royal Academy of Medicine*), "Gastro enterostomy, with description of a new clamp" (ibid, 1906), and "Abdominal aneurysm successfully treated by Colt's method" (ibid, 1913) In 1917 he was one of the chief surgeons attached to the Dublin General Hospital at Boulogne He was a member of the British Medical Association

THOMAS PERCY LEGG, C M G, M S, F R C S,

Surgeon and Lecturer on Surgery to King's College Hospital

We regret to record the sudden death of Mr T P Legg, C M G, F R C S, on October 10th, at his residence in Harley Street, at the age of 58

Thomas Percy Legg was born in Leeds, and received his early education at the old Yorkshire College, which has now expanded into the University of Leeds, he was later a student at St Bartholomew's and King's College Hospitals He obtained the diplomas of M R C S and L R C P in 1895, and the degree of M B Lond in 1896, in the following year he became F R C S, and in 1905 graduated B S, winning the university medal in surgery In 1906 he graduated M S After holding the post of house-surgeon at St Bartholomew's, and senior resident medical officer, and, later, surgeon to the Royal Free Hospital, he resumed his long association with King's College Hospital, where he was successively senior surgical registrar and surgical tutor, surgeon, and lecturer on surgery He was also consulting surgeon to the Italian Hospital, the Drury Lane Dispensary, Farnham Cottage Hospital, and Frimley Cottage Hospital He had been a member of the Court of Examiners of the Royal College of Surgeons of England since 1923, and was examiner in surgery at the University of Cambridge

In the war Mr Legg held the rank of colonel, and was consulting surgeon to the Mesopotamia Expeditionary Force His valuable services were recognized by the award of the C M G in 1917 He was the author of numerous papers on surgical subjects in medical periodicals, and was the author, with Sir James Berry, of a book on hare-lip and cleft palate Mr Legg was for many years a Fellow of the Royal Society of Medicine, and of the Medical Society of London The funeral was held at Scarborough on October 11th, and a memorial service was conducted in the chapel of King's College Hospital

We are indebted to Sir Lenthal Cheatle for the following tribute

By the sudden, unexpected, and premature death of Mr T P Legg the medical world has lost a conspicuous example of those men without whose devoted and unostentatious services the profession could not live The more public acts of Mr Legg's service to the profession were those of a lecturer and an examiner in surgery Whether his desires and great ability were fitted for original research or not, then indulgence was prohibited by the time occupied in carrying out other duties Perhaps his sound judgement and common sense, as well as the complete knowledge he possessed of his subject, were exploited to the best advantage in the spheres he selected for their employment The wearing and exacting nature of that work can be wholly appreciated only by those who have undertaken these elementary and critical duties Legg's reverent and conscientious attitude towards them probably hastened the end we all so grievously deplore His abounding sense of duty will act as an inspiration to those who will fill the gaps his death has caused In all his dealings with men his fund of pure, wholesome, and spontaneous humour rendered his companionship delightful, and his lectures popular as well as instructive His colleagues have lost a wise and independent counsellor, whose advice and notions were founded on careful and balanced consideration, having once made up his mind it could be altered by only very cogent reasons All patients alike in his private and hospital practice received his individual attention, and the best that surgery and human sympathy could give them in their need

A. E. WHITEHEAD, F.R.C.S.

Consulting Ophthalmic Surgeon, Leeds General Infirmary.

It was with great regret that we had to record last week the death of Mr. A. E. Whitehead, consulting ophthalmic surgeon to the General Infirmary at Leeds, which took place on the morning of Sunday, October 5th.

Arthur Longley Whitehead was a student of the Yorkshire College and of the Leeds School of Medicine about the time of the affiliation with Victoria University. He graduated at the University of London, taking the degrees of M.B. and B.S. (honours) in 1892 and 1893 respectively. In 1892 he obtained the diplomas M.R.C.S., L.R.C.P., and was elected a Fellow of the Royal College of Surgeons of England in 1924. After a good general training in surgery, during which he held the position of house-surgeon to Sir Arthur Mayo-Robson, he acted as resident ophthalmic and aural officer at the Leeds General Infirmary, and at this time definitely made up his mind to devote himself to the special departments of the eye, ear, and throat. He was appointed assistant surgeon to the ophthalmic and aural department in 1899, and in the same year both he and Mr. Secker Walker were promoted to the full staff, in consequence of the resignation of Mr. John Nunneley and the death of Mr. Bendelack Hewetson.

During the years before his appointment to the staff Mr. Whitehead had been a diligent worker, and the writer of this notice remembers being most favourably impressed by some of the communications which he made to the Leeds and West Riding Medico-Chirurgical Society. He was therefore fully equipped for taking his part in the development of the department. In 1912 it was decided to rearrange the work of the two associated departments, and the ophthalmic work was separated from the ear and throat work, Mr. Secker Walker and Mr. Whitehead electing to confine their energies to the former. Mr. Whitehead was lecturer on ophthalmology in the University of Leeds from 1912 till 1920, and his position as honorary officer to the Infirmary carried with it the position of clinical lecturer to the University in his subject.

Mr. Whitehead was a most accomplished operator and a man of sound judgement and of scientific acumen. His abilities were held in high repute, not only by his colleagues on the staff but also by the profession in the West Riding and by those engaged in ophthalmic work throughout the country. He was president of the Leeds and West Riding Medico-Chirurgical Society during the session of 1925–26, and was also president of the Ophthalmic Section of the Royal Society of Medicine and of the North of England Ophthalmological Society. He was honorary secretary of the Section of Laryngology, Otology, and Rhinology at the Annual Meeting of the British Medical Association in Exeter in 1907, and a vice-president of the Section of Ophthalmology in 1924 when the Association met at Bradford. Mr. Whitehead was a man of great charm of manner and of perfect integrity. An admirable chairman of different kinds of meetings, he owed his success alike to his ability, his tact, and his invariable courtesy. To a large circle of private and professional friends his death will come as a real grief, and he will long be remembered with feelings of respect and affection.

T. W. G.

Dr. JOHN REGINALD FULLER of Crouch End Hill, Hornsey, who died suddenly on October 7th, was born in December 1865, and received his medical education at the medical schools of St. Mary's Hospital and of the University of Durham. He obtained the L.S.A. in 1890, the conjoint diploma of the Royal Colleges in the following year, and the degrees of M.B. and B.S. Durh. in 1895. Seven years later, in 1902, he graduated M.D. in the University of Durham. After holding resident medical appointments at St. Mary's Hospital, at the Birmingham Children's Hospital, and at Hanwell Asylum, he settled in private practice in Hornsey, and rapidly acquired the confidence and affection of his patients, and very considerable influence among his fellow practitioners. He interested himself greatly in the establishment of the local cottage hospital, now the Hornsey Central Hospital, and with one or two of his colleagues was largely instrumental in securing the open method of staffing that hospital, a method then not so prevalent as now. His attention to the work of the hospital never flagged; he was continuously a member of its council and medical committee, and was for several years, and at the time of his death, chairman of the latter. For some time also he was a member of the Maternity and Infant Welfare Committee of the Hornsey Town Council. He had been a member of the British Medical Association for a very long time, and the present Chairman of Council of the Association will always remember that it was Dr. Fuller who first induced him to take an active part in the work of the Association. Dr. Fuller had been three times chairman of the North Middlesex Division, and was a member of the Metropolitan Branch Council for many years. He was a representative of his Division from 1904 to 1912, and had been for seventeen years a valued member of the Middlesex Panel Committee. In his earlier years he was a very successful football player, in both Rugby and Association games, and he remained an enthusiastic and skilful tennis player till a few years ago. His work was always good, and his opinion, whether on clinical or medico-political matters, well considered. His loss will be widely mourned among both the public and the profession of the neighbourhood in which he practised. Though he had not been well for a short time, his death was unexpected indeed, it was hoped that he might occupy the chair at the annual dinner of St. Mary's Medical School at the opening of the present session. He leaves a widow, two sons, and two daughters.

The following well-known foreign medical men have recently died: Professor BELLOMO PESCAROLO, a Turin neurologist, Dr. LUDWIG WEISS, lecturer in dermatology at the New York Post-Graduate Medical School, aged 61; Professor ANNIBALE BERTAZZOLI, head of the gynaecological department of the Ospedale Maggiore, Milan; Dr. REGO DE BARROS, director of the Medico-Legal Institute of Rio de Janeiro; Professor ARTUR KLEIN of Vienna, an authority on immunology; and Dr. BENJAMIN A. THOMAS of Philadelphia, professor of urology in the University of Pennsylvania.

Medico-Legal

CONSULTATION BETWEEN MEDICAL WITNESSES.

A CASE heard recently at the Westminster County Court, in the course of which the judge passed some severe strictures upon a general practitioner, well illustrates the desirability of full and free consultation between medical witnesses before trial where medical points are in issue.

In August 1929 a workman fell and broke his tibia and fibula some two or three inches above the ankle. Compensation was paid until May, when following a joint examination by the medical adviser to the employers and the man's panel doctor payment was stopped. The workman claimed however to be suffering from continued partial disablement, and at the hearing his panel doctor stated that he was suffering from flat-foot which he attributed to the fall. He agreed that there was now no disablement from the fracture. The suggestion that the man was suffering from flat-foot—the result of the fall—was not made to the employers until a few days before the case was to be heard—that is more than a year after the accident. In the box the panel doctor stated that he had noticed the flat-foot at the joint examination in May but did not call the attention of the other medical man to it. Asked why he did not do so he said: "The man's foot was there and I did not think it necessary to point it out." The judge strongly condemned this attitude, and at the conclusion of the case—which was decided against the workman—took occasion to warn practitioners that in these cases workmen are to a large extent in the hands of their medical advisers, and it was their duty to see that sound and adequate advice was given.

Those familiar with the procedure which is usually followed before a workman's compensation case is brought

into court will easily understand how a position so regrettable as this arises In spite of all the teaching to the contrary, too frequently it happens that when an interview between the medical representative of the employers and the medical man acting for the injured workman is arranged, the two meet, not as scientifically trained persons concerned only to arrive at the real facts and their causes and results, but as hostile witnesses each one placing the success of his own side first Hence, instead of full discussion of all the points and their possible issues, each may be trying to give as little information as possible about his own views, while endeavouring to detect weak points in the presentment of the case by the other side The result is seen in the deplorable events described above

It cannot be too strongly emphasized that in these questions the position of the medical man should be that of a scientific expert, and not that of an advocate The policy of the British Medical Association has always been to encourage a frank and complete interchange of views between medical witnesses, and this course facilitates the settlement of disputes out of court, maintains confidence in the integrity of the profession, and furthers the interests of justice

Universities and Colleges.

UNIVERSITY OF OXFORD

DR E W ASHBY WALKER has resigned the office of Dean of the School of Medicine Dr M H Mackeith, Fellow of Magdalen, has been appointed to succeed him

The following are the days on which degrees will be conferred in this University during the coming term Saturday, November 22nd, and Wednesday, December 17th

UNIVERSITY OF LONDON

AT its meeting on October 8th the University Court unanimously re elected Lord Macmillan to be Chairman of the Court during the session 1920-31, and Mr S L Loney to be Deputy Chairman

The following candidates have been approved at the examination indicated

D P H—Hilda M P Bond Annie C Easterbrook C Harbans Lal Marjorie H James H D Jhingan W P Jones D Magrath Edith A Straker Helen B Sutherland *Part I only* D Ross

UNIVERSITY OF BIRMINGHAM

THE jubilee of Mason College and the thirtieth anniversary of the granting of a charter to the University of Birmingham were celebrated on October 13th in the presence of delegates from universities and university colleges and other learned institutions The proceedings opened with a special congregation, at which the honorary degree of LL D was conferred by the Chancellor (Viscount Cecil of Chelwood) upon twelve distinguished persons including Sir Thomas Lewis, M D , F R S and Sir William B Hardy F R S Before delivering an address to the assembly Lord Cecil announced the receipt of a message from the King congratulating the University of Birmingham upon the remarkable development of its work during half a century At a luncheon party the toast of the honorary graduates was proposed by the Chancellor, and Lady Astor and Lord Macmillan replied After luncheon the new and handsome headquarters and club of the Guild of Undergraduates' Union were opened by Sir Charles Hyde, and in the evening the Chancellor gave a reception

UNIVERSITY OF LIVERPOOL

THE following candidates have been approved at the examination indicated

D T H—H R Dundale I D A Gray R Krishna H S Lawrence I Macdonald I S R Menon Nora M Wilson

UNIVERSITY OF DUBLIN

Montgomery Lecture

ON Thursday October 30th at 5 o clock Dr F S Lavers will deliver a lecture entitled Trachoma, with special reference to its sociological aspect, as the Montgomery Lecture for the year 1930

SCHOOL OF PHYSIC TRINITY COLLEGE

The following candidates have been approved at the examination indicated

FINAL MEDICAL (*Part I Materia Medica and Therapeutics Medical Jurisprudence and Hygiene Pathology and Bacteriology*)—O S Torrens (prize (1on high marks) I N Concannon I R Coughlan W J Craig I W O Lyan Edith M J Broderick C H M Mahon I I Russ H I W Craig P C Daly I King Dorothy R R Solomons W T Birmingham

UNIVERSITY OF MANCHESTER

THE following candidates have been approved at the examination indicated

D P H—*Part II* A H Hoyworth Frances A Hogbon A Melklejohn

ROYAL COLLEGE OF SURGEONS OF ENGLAND

A QUARTERLY Council meeting was held on October 9th, when the President, Lord Moynihan, was in the chair

The late Mr T P Legg

A vote of condolence was passed on the death of Mr T P Legg, C M G , member of the Court of Examiners

Gold Medal

Mr R Lawford Knaggs was introduced and was presented with the honorary Gold Medal of the College

Scholars

Mr L I Honeywell was introduced and was presented with the document certifying his appointment as the first Macleghan Scholar, together with a cheque, being the first payment on account of his scholarship

Mr Frederick Basil Kiernander, until lately a student at Epsom College, was nominated as the thirty eighth Jenks Scholar

Librarian

Mr W R Le Fanu was introduced and was admitted to the office of Librarian

Membership

Diplomas of Membership were granted to the following, who have complied with the by laws: H R Hoysha, A H Leudon, D K Mulvany, A L Dovi

Lectures

The President reported that the Thomas Vicary Lecture on "Vicary's predecessors' would be delivered by Professor G P Gask on Thursday November 6th at 5 p m and that the Bradshaw Lecture, on 'Ocular muscles, movements and judgements would be delivered by Mr J Herbert Fisher on Thursday, November 13th, at 5 p m

Primary Fellowship Examination in Canada

The Secretary reported that at the primary examination in anatomy and physiology for the Fellowship conducted by Professor William Wright and Professor John Mellanby at Montreal on September 2nd 3rd and 5th last, 13 candidates were admitted to examination, and that of these 3 were approved—one from an American university, one from an Australian university, and one from an English university—and 10 were rejected

Royal College of Physicians and Surgeons of Canada

The President reported that he had made inquiries regarding a body styled the Royal College of Physicians and Surgeons of Canada and that he was informed by the Secretary of State for the Dominions and Colonies that this body was incorporated by an Act of the Canadian Parliament in 1929 and that the use of the title 'Royal" was approved by His Majesty the King on the recommendation of His Majesty's Government in Canada and that Section 8 (3) of the Act provides that Fellows of the College may be known and designated as Fellows of the Royal College of Surgeons of Canada or Fellows of the Royal College of Physicians of Canada

Medical News.

THE University of Pennsylvania has conferred the honorary degree of LL D on Sir Walter Fletcher, and the D Sc on Professor A V Hill

LORD D'ABERNON has accepted the office of president of the National Institute of Industrial Psychology, in succession to the late Earl of Balfour, its first president

FLORENCE NIGHTINGALE HOUSE, which has been built as a nurses' home in connexion with Harrow Hospital, will be opened by Miss Diana Churchill to day (Saturday, October 18th) at 3 15 p m After the ceremony the Stuart Memorial Hospital extension will be on view although it has not yet been completed Harrow Hospital was founded in 1866, and has now received more than 16,000 patients

FOUR lectures on health and social evolution will be given by Sir George Newman at the Memorial Hall, Farringdon Street, E C , on November 4th, 6th, 11th, and 13th The titles of the lectures are How England learned to control disease health problems of the modern period, modern collective humanism at work, and gains and losses in national health Admission is free Tickets for free reserved seats may be had from the secretary, Halley Stewart Trust, 32, Gordon Square, W C 1

THE detailed programme of special lectures arranged by Professor W W Jameson at the London School of Hygiene and Tropical Medicine in connexion with the course of study for the Diploma in Public Health has now been issued These lectures are open, not only to the D P H students at the school, but also to any member of the Public Health

Service and indeed to all interested members of the general public Copies of the programme may be obtained from the secretary of the School, Keppel Street W C

THE new series of post graduate lectures at King s College Hospital Medical School, Denmark Hill, S E 5, commenced on October 9th and will be continued on succeeding Thursdays till March 19th, with the exception of the last Thursday of the present year and the first of 1931 The lectures, which are free to all medical practitioners and to final year students of King s College Hospital, will commence at 9 p m and coffee will be served in the common room at 8 45 p m

A SERIES of four post graduate lectures on cancer will be delivered under the auspices of the Yorkshire Council of the British Empire Cancer Campaign, on Wednesdays October 22nd November 26th February 4th, and March 5th, at 5 30 p m The first of these lectures will be held in Leeds in conjunction with the Leeds and West Riding Medico Chirurgical Society, when Sir Almroth Wright will speak on medical research Professor Beckwith Whitehouse will deliver the second lecture discussing uterine haemorrhage with special reference to malignant disease This lecture will be given at Halifax in conjunction with the Halifax Division of the British Medical Association The third lecture will be delivered in Leeds in conjunction with the Leeds and West Riding Medico-Chirurgical Society the lecturer Dr Canti will show his film demonstrating the growth *in vitro* of living tissue cells Mr Ernest Miles will deliver the fourth lecture at Huddersfield in conjunction with the Huddersfield Medical Society his subject being the symptomatology and treatment of cancer of the rectum

THE autumn session of the South West London Post Graduate Association will commence at St James s Hospital, Ouseley Road Balham, S W on Wednesday, October 22nd, at 9 p m , when Major Stevens will show the Nepal film taken by the Ross Institute Malarial Expedition Ladies are invited, and coffee and refreshments will be served at 8 30 p m

THE St John s Hospital Dermatological Society will open its new session at 49 Leicester Square W C on Wednesday, October 22nd, at 4 15 p m , when clinical cases will be discussed

THE annual service in Liverpool Cathedral in aid of the Royal Medical Benevolent Fund will be held on October 19th at 3 p m when the preacher will be the Ven G J Howson, M A Archdeacon of Warrington The Lord Mayor and Lady Mayoress will be present and members of the medical profession with their friends are cordially invited to attend Tickets may be obtained from the honorary secretary Dr R Kennon 23, Rodney Street, Liverpool

THE Fellowship of Medicine announces the following lectures at the Medical Society lecture room, 11, Chandos Street Cavendish Square, in the evening series for the M R C P examination at 8 30 on Tuesday, October 21st, Dr L S T Burrell, on bronchiectasis and abscess of the lung and on Friday October 24th Dr Donald Hunter on diseases of calcium and phosphorus metabolism and of the parathyroid glands Tickets may be taken at the lecture room On Monday October 20th at the same place at 4 p m a free lecture will be given by Mr John Hunter on recent advances in surgery of the chest The following free demonstrations will be given at St Mark s Hospital, at 3 30 p m on Tuesday, October 21st by Mr L E C Norbury and at the East London Hospital for Children Shadwell on Wednesday October 22nd, at 10 a m by Dr Hazel Chodak Gregory The following future courses are also announced October 27th to November 8th at Great Ormond Street Hospital, mornings only (limited to 20) October 27th to November 8th at the Royal National Orthopaedic Hospital, Great Portland Street all day (minimum of 12) October 27th to November 15th, at the Royal Westminster Ophthalmic Hospital Broad Street, afternoons only ante natal clinical demonstrations by Dame Louise McIlroy on four Wednesdays at 5 p m , from November 5th to 26th, at the Royal Free Hospital Copies of all syllabuses may be obtained from the secretary of the Fellowship, 1, Wimpole Street W.1

A MEETING of the Medico-Legal Society will be held at 11 Chandos Street, W 1, on Thursday October 23rd at 8.30 p m , when a paper will be read by Dr Letitia Fairfield on Women mental defectives and crime a practical study A discussion will follow The annual dinner of the society will be held at the Holborn Restaurant on Friday December 12th Further meetings of the society have been arranged for October 23rd November 27th January 22nd (1931) February 26th, March 26th April 23rd May 23th, and June 25th

ON Monday, November 17th, Mr A N C Shelley will give a lecture before the Royal Institute of British Architects on 'Public control of building the position in 1930 The meeting will be held at 8 p m at 9 Conduit Street Hanover Square W We are asked to say that the Institute extends a cordial invitation to members of the British Medical Association to be present at the meeting and to take part in the discussion

A SYSTEMATIC course in dermatology will be held at the London School of Dermatology St John s Hospital for Diseases of the Skin, Leicester Square on Tuesdays and Thursdays, from October to March at 5 p m An examination will be held at the end of the course and the Chesterfield medal will be awarded to the best candidate Arrangements can also be made for classes individual instruction, or research at the hospital Further particulars may be obtained from the dean

SIR WILFRED GRENFELL is conducting a tour in Great Britain and Ireland lecturing on his work in Labrador a list of places to be visited by him can be obtained from the Lecture Agency Ltd , Outer Temple W C 2 The Grenfell Association of Great Britain and Ireland whose offices are at 82 Victoria Street, S W 1, has issued a leaflet (No 13) giving an account of the various industries carried on in support of this organization Articles are exhibited and may be purchased at the offices of that association , they include rugs toys, ivories, clothing Christmas cards and books by Sir Wilfred Grenfell All profits from the sales are devoted to the furtherance of his work in Labrador and Northern Newfoundland

THE through Riviera express "Boulogne Vintimille" in connexion with the 2 p m service from Victoria, which commences running on October 25th will this year be worked via Laon Chalons sur Marne, Chaumont, and Is sur Tille, thus avoiding Paris

THE International Labour Office has published seven further leaflets, Nos 213 to 219, dealing with the occupational pathology of the medical and allied professions men of letters, speakers etc the digestive system and general metabolism statistics the nervous system artificial pearls and personal hygiene The brochure entitled *Occupation and Health* which contains these seven leaflets, may be obtained from the director of the London office of this organization 12, Victoria Street S W 1

THE *West African Medical Staff List* for 1930 contains the usual three sections, showing the grading, the distribution between the several colonies served, and the individual qualification and service of members of the staff and of the fifteen women now serving in West Africa It is issued by the Crown Agents for the Colonies, 4 Millbank, Westminster, S W 1

WE are informed that the Belgian periodical *Le Cancer* will henceforth be issued in fascicuil, four of which will complete a volume Each fasciculus will contain original articles in English French, German and Italian a survey of cancer problems and summaries of contents of recently published books and articles dealing with cancer Space will also be found for periodical bulletins of the National Belgian League against Cancer

THE Cambridge University Press announces for early publication *The Growth of Visual Perception in Children* by Dr W Line being the fifteenth monograph supplement to the *British Journal of Psychology*

IN the October issue of *The World s Children* there appears an illustrated account by Dr E Gorter, professor of paediatrics in the University of Leyden, of a new hospital for diseases of children which has been erected by the State and is intended to be a university hospital The expense of upkeep will be borne by the State except for small contributions by the parents of patients The wards on the ground floor are divided by glass walls into cubicles, most of which have only one bed and serve for isolating doubtful cases Special accommodation is provided for the instruction of medical students and there are laboratories for clinical, chemical, bacteriological and serological research

WITH the title *Photography Simplified Printing and Toning* Burroughs Wellcome and Co have issued a small booklet describing pictorially as well as textually the more important points concerned in obtaining good photographs The booklet will be supplied free on application to that firm

THE second Pan Russian Congress of Microbiology will be held at Moscow from December 27th to 30th 1930 when the following subjects will be discussed (1) B C G vaccination against tuberculosis (2) dissociation and cycle of development of micro-organisms particularly of the typho-intestinal group and pseudo-tubercle bacilli (3) the nature of toxin and anatoxin The following subjects have also been suggested (1) tissue cultures (2) typhus fever—nature of the virus and immunity (3) the bacteriophage and (4) undulant fever and contagious abortion in cattle Abstracts of communications should be sent before November 1st to the office of the congress Povrouka 44 Moscow The subscription is five roubles

Letters, Notes, and Answers.

All communications in regard to editorial business should be addressed to ***The EDITOR, British Medical Journal, British Medical Association House, Tavistock Square, W C 1***

ORIGINAL ARTICLES and LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone unless the contrary be stated Correspondents who wish notice to be taken of their communications should authenticate them with their names, not necessarily for publication

Authors desiring REPRINTS of their articles published in the *British Medical Journal* must communicate with the Financial Secretary and Business Manager, British Medical Association House, Tavistock Square, W C 1, on receipt of proofs

All communications with reference to ADVERTISEMENTS, as well as orders for copies of the *Journal* should be addressed to the Financial Secretary and Business Manager

The ***TELEPHONE NUMBERS*** of the British Medical Association and the *British Medical Journal* are *MUSEUM 9861, 9862, 9863,* and *9864* (internal exchange, four lines)

The ***TELEGRAPHIC ADDRESSES*** are

EDITOR OF THE *BRITISH MEDICAL JOURNAL, Aitiology Westcent London*

FINANCIAL SECRETARY AND BUSINESS MANAGER (Advertisements, etc), *Articulate Westcent, London*

MEDICAL SECRETARY, *Mediocra Westcent, London*

The address of the Irish Office of the British Medical Association is 16, South Frederick Street, Dublin (telegrams *Bacillus, Dublin*, telephone 62550 Dublin), and of the Scottish Office, 7, Drumsheugh Gardens, Edinburgh (telegrams: *Associate, Edinburgh*, telephone 24361 Edinburgh)

QUERIES AND ANSWERS.

SOUND PROOF PARTITIONS

"D M O" writes I shall be very glad of any information in regard to dividing my consulting room into two parts by a partition Can any reader recommend a material which is soundproof, and thin and light in weight?

AMENORRHOEA IN A GIRL

"M E P" (South Africa) writes I have under my care a case of functional amenorrhoea which has resisted all medical treatment—tonic, polyglandular, etc The girl menstruated for the first time when 13 years old, had two or three normal menstruations which then ceased absolutely She is now 14 years of age Hypertrophied tonsils and adenoids were removed about nine months ago The patient is a big, strapping, athletic type, but has no abnormal features She has grown somewhat rapidly in the last year or two She is active, has a good appetite, and is normal in every other respect As her mother is somewhat anxious, would any reader advise regarding treatment?

KEEPING FIT IN HOT CLIMATES

"ANCIENT" writes I have lived for forty seven years in India, forty of which were in the plains For the first twenty five years I was in one appointment, and during that time I was only on the sick list for ten days, part of which at the age of 45 was due to mumps I had contracted from a patient, and thus not due to anything climatic The following are some of the rules I have acted upon I secured plenty of exercise—I played rackets till I was 65 I eat what there is going, but avoid all tinned foods, except jam In the old punkah days I always had three coolies to myself, to make sure of a good night's rest Now with electric fans matters have greatly improved in that respect Ice must not be stinted in the hot weather For drink in India I consider the best of all is an ounce of good whisky to a full bottle of soda water I have taken very little of beer and the strong wines, and then only on festive occasions There must be no fretting over trifles such as a mosquito bite Take all the leave possible Now at the age of 78, in a temperature nearly 90° I walk two or three miles a day, climbing hillsides and clambering over rocks and other rough country

CHEIROPOMPHOLYX

DR WILLIAM LIVINGSTONE (Seaford) writes I have come across two cases similar to that described by "Symington" on October 4th (p 586) The one case was caused by weeding, and the other by washing the hands in too strong lysol solution, there was redness and itching over the fingers, and tiny vesicles with dark centres developed The fluid seemed sterile These vesicles confesced and formed Hack's pocks Duration of disease about six weeks I found the following treatment most useful first wash in very hot water, using coal tar soap, secondly, bath in lotion 5 per cent solution of aluminl acetate, diluted 1 in 5 hot water followed by linimentum calaminae or ung hydrarg ox flav Wear gloves out of doors

INCOME TAX

Post Graduate Work. Expenses

"POST GRADUATE" sold his practice as from December 31st, 1929, and may take up professional work when his present course of study has been completed In the meantime his car continues to depreciate, and he is incurring expenses by way of professional subscriptions

*** These expenses are proper subjects of deduction in computing professional profits, but during periods when a practitioner is not in employment or in practice—that is, when there are no gross professional receipts against which to set these expenses—no allowance is due, they cannot, for instance, be set against income from investments

LETTERS NOTES ETC

THE FOOT AND THE SHOE

"W A D L" writes I am much interested in the letter by "M B, D P H" (September 27th, p 548), and in general I agree with him whole heartedly My wife, who has not a large foot—certainly it is not a long one, but it is rather wide, and she also has a high instep—has found great difficulty in getting a British shoe broad enough, which is not also too long Court shoes on this account she has had to forego Recently, quite by chance, she discovered that a firm with a French name, who have many branches in London, could fit her perfectly in any type of shoe required They have at least five widths to every style and size The inner side of the shoe, perhaps, cannot be said to be absolutely straight, but there is plenty of room for the toes, and the pair she purchased are certainly everything that one could desire in smartness

HERPES AND VARICELLA

DR J R HICKINBOTHAM (Colchester) writes On August 14th A B, aged 38, complained of intense pain in the left side of his face and head, and had a small cluster of herpetic vesicles on his left cheek On August 16th the herpetic rash was severe and typical over the distribution of the two upper divisions of his left fifth nerve His left eye was much inflamed On August 18th he called my attention to a few pustules on both his wrists which he had noticed that morning, and further search revealed a few pustules on both sides of his back and on his abdomen, and one on his right ankle They dried up and the scabs came off in a few days The herpes of the face formed dense scabs, which had nearly all separated by September 1st On August 30th, twelve days after the appearance of the scattered pustules, A B's baby, aged 10 months, showed about half a dozen scattered vesicles, and on September 1st had a profuse chicken pox rash of typical character

CHLOROFORM IN MIDWIFERY

"G P" writes In considering the choice of an anaesthetic in midwifery Dame Louise McIlroy (*British Medical Journal*, October 4th, p 549) suggests that the reason why chloroform is safe in midwifery is because we do not induce deep anaesthesia May I point out that the danger is in the struggling stage, more than in the stage of deep anaesthesia? Who ever heard of a death from chloroform in midwifery, and why is it so safe? The thyroid is more active than usual in these cases, and in consequence metabolism is increased and with it elimination There is seldom vomiting in these cases, and this would also point to free elimination If this is the true explanation, the giving of thyroid before other operations would be helpful

ANALGESIA AFTER CHILDBIRTH

DR C J HILL AITKEN (Kilnhurst, near Rotherham) writes Multiparae often dread after-pains more than labour pains Some years ago I was told to try phenazonum From the way multiparae who have received this drug to relieve after pains continue to ask me to be sure and send up 'one or two of those powders' I presume this remedy must give great relief I am referring to normal labours, of course Jardine, in *Clinical Obstetrics*, states that "multiparous patients will almost invariably suffer from after pains for thirty six to forty eight hours after labour"

HINTS TO YOUNG PARENTS

To Mothers and Fathers, described by the Association of Infant Welfare and Maternity Centres as 'a textbook of 82 pages giving clear and invaluable information on how to keep oneself and one's children well and strong, is now in its tenth edition (604th thousand) The work has been completely revised and sections have been added on rickets, rheumatism bed wetting, and elementary psychology Copies may be obtained (price 6d) from the Association of Infant Welfare and Maternity Centres, 117, Piccadilly, London, W 1

DISCLAIMER

WE have been asked by Dr H N Bradbrooke of Abingdon to state that a photograph recently reproduced in a local newspaper showing him *x* raying a patient at the new cottage hospital was published entirely without his authority

VACANCIES

NOTIFICATIONS of offices vacant in universities, medical colleges, and of vacant resident and other appointments at hospitals, will be found at pages 59, 60, 61, 62, 63, 66, 67, and 68 of our advertisement columns, and advertisements as to partnerships, assistantships, and locumtenencies at pages 64 and 65

A short summary of vacant posts notified in the advertisement columns appears in the *Supplement* at page *179*

EPITOME OF CURRENT MEDICAL LITERATURE.

Medicine.

344 Prevention of Hypostatic Pneumonia.

C I Baastrup (*Ugeskrift for Laeger* August 14th 1930, p 762) draws attention to the risk of hypostatic pneumonia when an elderly patient is confined to bed The alternative of making the patient sit up in bed has the disadvantages of causing fatigue and giving rise to stiffness about the hips further, this device does no greatly raise the level of the lower part of the thorax Baastrup insists that his patients shall lie half an hour during the morning midday, and evening on the right side and half an hour on the left He remarks that although numerous practitioners doubtless avail themselves of this or a similar device the textbooks consulted have been practically silent on the point While it is natural to suppose that simply for mechanical reasons, expectoration coming from the right lung escapes by the right bronchus most easily when the patient lies on his left side, and vice versa, this is not the most important factor which comes into play When the patient lies on the right side an *x* ray examination shows the outer edge of the apex of the heart to be 7 cm from the outer limits of the left thorax whereas this distance is reduced to 4 5 cm when the patient lies on his left side When the patient lies on the right side the vault of the left side of the diaphragm is 3 5 cm lower than when he lies on his left side Lying on his right side the patient displaces the vault of the right side of his diaphragm 4 cm higher than when he lies on his left side It will thus be seen that by the simple device of changing from one side to the other very considerable movements of the intrathoracic organs are effected Measurements of the dimensions of the lungs in the two postures right and left sided decubitus showed, by the help of *x* rays and paper mapped out in square centimetres that when a patient reclined on the right side the area of the left lung in view was 213 square cm whereas this figure was reduced to 155 when the patient lay on the left side Similarly, the surface area of the right lung visible to the *x* rays with the patient on his right side was 190 square cm , whereas when he lay on the left side this figure was increased to 236 Another advantage of making the patient lie by turns on the right and the left side is the diminished risk of bed sores

345. Early Diagnosis of Whooping cough.

According to L W Sauer and Leonora Hambpecht (*Journ Amer Med Assoc* July 26th 1930 p 263) the cough plate method introduced in 1916 by Chievitz and Meyer is the best way of obtaining an early diagnosis in whooping cough A plate containing a medium of potato-blood organ is held three or four inches from the mouth and the patient gives several deep expulsive coughs the plate is incubated in an inverted position within a few hours after exposure Examination for colonies of *B pertussis* should be made at the end of the second day if they are very numerous they appear as minute glistening mercury like droplets amid the larger saprophytic colonies If the colonies are few they may not be recognized until the fourth or even the fifth day On staining by Gram s method or by toluidine blue the organisms are seen as small delicately staining ovoid bacilli some of which show bipolar staining Although the course of the whooping cough is little influenced by early diagnosis the patient and any susceptible children exposed to infection can be quarantined before they infect others

346. The Body Systems in Epilepsy

J Felsen (*Arch Int Med* August 1930 p 180) reports upon an intensive laboratory study of the various systems of the body in 73 epileptics All the patients were men and nearly all were between the ages of 21 and 31 normal controls of approximately the same ages were obtained The findings presented significant variations from the normal pointing to the need of making more careful studies of individual patients for a clue to the pathogenesis of epilepsy As regards the stomach a complete absence of free hydrochloric acid was noted in 11 per cent of the epileptic cases observed The blood picture showed higher leucocytosis and lymphocytosis figures during the paroxysmal period than during the interparoxysmal period An increase in the uric acid and chloride contents of the blood was noted in the interparoxysmal period and there was general reduction in chlorides and an increase in uric acid in some cases as the effect of a salt poor diet As regards the renal function, the excretion of phenolsulphonephthalein excretion was diminished in about half the cases and the general high chloride excretion was lowered during a course of salt poor diet Many epileptics were able to tolerate and store large amounts of carbohydrate without its subsequent appearance in the urine in one of the fifteen minute specimens Protein sensitization estimations were made, but there was no instance of a skin reaction to any of the many food and bacterial proteins used Some stools were classified as abnormal from their colour, consistency the presence of blood, or evidence of faulty digestion it is concluded that many epileptics may be benefited by colonic eliminative measures, or dietary limitations or both The general freedom from organic cardiac defects among epileptics was surprising, and it was found that there was a considerably lower percentage of high basal metabolic rates among them A detailed study of the skulls of epileptics revealed a high proportion of pathological conditions compared with those of normal persons Felsen remarks that studies of the vegetative nervous system suggest that the state of the epileptic may be regarded as one of "vegetative instability, but the cause of this instability and its relative importance in the production of a seizure has yet to be explained and interpreted

347 Diphtherial Vulvo-vaginitis

A Stammer (*Zeit f Kinderheilk* , August 23rd 1930, p 132) who records an illustrative case, states that diphtherial vulvo-vaginitis is a relatively rare condition being found chiefly in children who are already suffering from nasal or faucial diphtheria As a rule, the patients are either neglected and dirty individuals, or their resistance has been weakened by measles chicken pox, or typhoid and they have become secondarily infected with diphtheria In rare cases diphtherial vulvo-vaginitis is a primary condition, the infection being conveyed from diphtheria patients to healthy persons by the hands The prognosis is almost always favourable and it is only when the ulceration is extensive that septicaemia is likely to arise Stammer s patient was a girl aged 8 years suffering from threadworms she was admitted to hospital with inflammatory oedema of the labia minora the inner surface of which was covered with whitish yellow deposit There was a haemorrhagic discharge from the vagina which was also covered with thick pseudo-membranous deposit Micturition was very painful Numerous diphtheria bacilli were found in smears and cultures Recovery followed the injection of 6 000 units of antitoxin the use of sitz baths containing a bright red solution of potassium permanganate and the application of 5 per cent precipitate ointment to the labia

Surgery

348. Thoracoplasty in Tuberculous Empyema.

E Archibald (*Canadian Med Assoc Journ* , August 1930 p 160) records the results obtained by thoracoplasty in 34 cases of tuberculous empyema He recognizes three forms of this disease seropurulent effusions purulent effusions and severe mixed infection effusions The first class is characterized by a persistent seropurulent effusion containing tubercle bacilli In such cases when the disease in the lung before the onset of the effusion is of the chronic ulcerative type with cavities when the degree of compression from pneumothorax is not total and when the effusion after five or six aspirations with air replacement recurs constantly Archibald performs a *total thoracoplasty in order to produce* a pleural symphysis and so abolish the effusion In eight cases of this type treated by this method there have been no deaths and no post operative exacerbations There have been three practical cures one marked and one moderate improvement In the second class the effusion consists of a thick greenish or yellowish pus Operation on these patients is urged in the hope of obliterating the pleural space by a thoracoplasty with simultaneous aspirations and thus preventing the change into the dreaded mixed infection type A more complete thoracoplasty is necessary than the standard posterior paravertebral operation The author, as a rule removes in three or four stages, at intervals of one to two weeks the whole of the ribs from the transverse processes to the cartilages Of eleven cases in this class, two were practically cured while two were much and three moderately improved In the third class, the symbiosis of

streptococci and staphylococci, sometimes also of anaerobic organisms, with tubercle bacilli, seems to have a most serious constitutional effect In twelve of fifteen cases of this group a costectomy with drainage was the first surgical measure Of these twelve, eight had to be left without further operation, of these patients seven died and the remaining one is rapidly growing worse In the other seven of the fifteen a total thoracoplasty was performed in three or four stages Of these patients two are able to work for a full day, two can go about freely and work a little, one is greatly improved nine months after operation, and two died in hospital Archibald considers that these figures afford sufficient argument for advising a thoracoplasty in most cases of chronic tuberculous empyema Three case histories are given as illustrations of the types of empyema described and the treatment instituted

349 Subacute Pancreatitis

DEWITT STETTEN (*Annals of Surgery*, August, 1930, p 248) comments on the high mortality in cases of acute pancreatitis, the figures of which range from 71 to 55 per cent He suggests that earlier diagnosis and surgical intervention are the only means of lowering the number of deaths from this disease *If the premonitory symptoms could be recognized*, and the disturbance be corrected in its early stage, the eventual serious lesion might be avoided Inflammatory changes in the pancreas are usually due to a primary disturbance in the biliary system, disease of the gall bladder and biliary calculi are found in the vast majority of cases of pancreatitis In subacute pancreatitis the pancreas shows enlargement and induration, due to oedema, and not to true suppuration, frank haemorrhage, or actual necrosis, as in cases of the acute variety Operation for subacute pancreatitis discloses no gross disease of the gall bladder There is usually a history of attacks of pain recurring at intervals over a period of months or several years The pain, which is very severe, is situated in the mid epigastrium, and usually radiates to the left The main objective sign is tenderness on deep pressure in the epigastrium, with little or no rigidity There is often a definite "head zone" of hyperaesthesia in the left flank at the level of the eighth to the tenth dorsal Nausea and vomiting may occur, but are not outstanding symptoms There may be some leucocytosis, a trace of glycosuria, or a mild degree of hyperglycaemia The treatment, which should be surgical, is best undertaken as soon as the diagnosis has been confirmed by *x* ray examination, which will show a negative condition of the gall bladder, stomach, and duodenum If a definite subacute involvement is found a cholecystectomy should be performed in most cases, the cystic duct stump area being drained The pancreas should be exposed, preferably through the gastrohepatic omentum, the peritoneum overlying the pancreas, which constitutes the posterior wall of the lesser sac, should be transversely incised as widely as possible, and cigarette drains be left in This form of decapsulation relieves the congestion and oedema, and helps the gland to recover its normal condition Although the cases so treated have been few, the end results have been good, and there were no deaths in the three cases reported

350 Gall-stone Operations in Japan

H MIYAKE and F ISHIYAMA (*Deut Zeit f Chir*, July, 1930, p 187) have studied clinically and statistically 754 cases of operation for gall stones in Japanese subjects, they conclude that gall stones in Eastern countries differ in many respects from those occurring in Europe and America The fact that bilirubin stones were more common and cholesterin stones less common than in Western countries is ascribed to differences in diet metabolism between the white and coloured races Cases of calculi due to such parasites as ascaris were common in Japan, but are now diminishing owing to the improved hygiene The material collected gave no statistical evidence that pregnancy was an important etiological factor, the incidence in the two sexes being almost equal in Japan Though typhoid fever is common in Japan, typhoid bacilli were only rarely found as the cause of gall bladder disease, while *B coli* infections often played an important part

351 Treatment of a Thrombosed Varicose Vein

W P WOSNESSENSKI (*Zentralbl f Chir*, August 16th, 1930, p 2055) describes a case of extreme varicosity of the whole extent of the great saphenous vein on the right side, associated with thrombotic changes Operation was considered the best mode of treatment, and after two parallel incisions had been made, one on each side of the vein along its whole length from the saphenous opening to the ankle, the vein together with the overlying strip of skin was removed *en bloc* This procedure left a raw area, over which the skin had to be stretched to a considerable extent in order to approximate the edges The wound healed by first intention and the patient began to walk in twenty days The author enumerates the advantages of this method as follows The usual lengthy operation with its laborious separation of the vein from the skin is avoided The skin, which has to be stretched across the raw area, acts as an elastic stocking The danger of necrosis of the skin edges and consequent healing by granulation would appear to be small, since the raw area was as much as 3 to 4 inches across in one place, and the patient was in a debilitated condition

Therapeutics.

352 Antitoxin Treatment in Scarlet Fever

J D ROLLESTON (*Practitioner*, July, 1930, p 236) reports his observations on 450 cases of scarlet fever treated by antitoxin In 214 the benefit was immediate and dramatic, as shown by improvement of the general condition, fall of temperature to normal within twenty four hours, and rapid disappearance of the eruption, though as a rule the constitutional change took place some time before the rash had faded In 200 cases the improvement, though definite, was less sudden and pronounced, while in 36 no benefit of any kind resulted The serum was almost always injected intramuscularly, and in only a few very severe cases intravenously Repeated injections were required much less frequently than in the case of diphtheria, only 21 of the 450 cases had two injections and three patients received three injections The doses were usually 30 to 40 c cm, irrespective of the age of the patient, which ranged from 1 to 51 years Serum rashes, which were observed in 202 cases (44 8 per cent), were urticarial, with the exception of one case of circinate erythema, and were either localized at the site of injection or were more or less generalized As a rule the eruption was not accompanied by any rise of temperature or constitutional disturbance Like most observers, Rolleston holds that the chief value of the serum treatment of scarlet fever lies in its power to alleviate the toxic symptoms of the acute stage, while it has little if any action in preventing complications

353 Liver Treatment in Pernicious Anaemia

L V VARGA (*Münch med Woch*, August 15th, 1930, p 1397) followed up a number of patients with pernicious anaemia who had been discharged from the clinic after successful treatment by liver preparations He found that those who did not continue treatment rapidly relapsed, those who took liver preparations from time to time gradually lapsed into a state of chronic invalidism, while patients receiving liver extracts regularly and continuously remained well for a considerable time, but eventually developed serious spinal disease or psychosis Those patients, on the other hand, who took cooked or raw liver instead of liver extract, usually on account of lack of means, were all in good health and showed practically normal blood pictures Some of the relapsing patients were readmitted, and in these it was found that the same liver preparation which had previously been successful now produced only a gradual and incomplete improvement Treatment by the administration of liver substance, however, was usually efficacious In view of these findings the author concludes that while liver preparations are useful in the early or acute stages where feeding with large quantities of liver may be impossible, actual liver diet should always be prescribed for prolonged administration after the patient has been restored to health Treatment is always more difficult and less satisfactory after a number of severe relapses, since these appear to exhaust the reserves of the patient The total duration of the disease, however, has little influence on the efficacy of the treatment

354 Paravertebral Alcohol Injections in Angina Pectoris

ACCORDING to J C WHITE (*Ame Journ of Surg*, July, 1930, p 98) a knowledge of the cardiac innervation is necessary to obtain good results from paravertebral alcohol injections in angina pectoris Pain from the heart and ascending arch of the aorta is conveyed to the sympathetic trunk by post ganglionic, unmyelinated fibres travelling in the superior, middle, and inferior cardiac nerves to the corresponding *cervical* sympathetic ganglia, and in the recently discovered nerves which run directly across the mediastinum from the posterior cardiac plexus to the upper dorsal sympathetic ganglia Painful stimuli are carried to the spinal cord by pre ganglionic, myelinated fibres in the upper dorsal white communicant rami Since there are no white rami in the cervical region, all pain sensation referred over the cervical sympathetic trunk must descend to the upper dorsal region before it can reach the spinal cord Pain referred to the left or right precordium and arm enters the cord only on the

same side The vagus contains no important sensory fibres Operations on the cervical sympathetic trunk even if they include the stellate ganglion cannot interrupt all the pathways of cardiac pain The upper dorsal communicant rami or their sympathetic ganglia are the logical points at which to interrupt painful stimuli from the heart These data have been tested by White in 21 cases, and in each instance where a successful blocking of the sympathetic rami in the segments corresponding to the referred pain has been assured the angina pectoris has disappeared Alcohol injection is difficult technically because of the depth of the rami and the small area which is sclerosed by the alcohol Nevertheless White thinks that it is the safest method, and that its results are distinctly better than those following cervical sympathectomy In exceptional patients who are unusually favourable operative risks White removes the upper dorsal sympathetic ganglia in order to avoid the risk of a poor result from an unsuccessful alcohol injection G I SWITLOW (*ibid*, p 88) reports similar good results in angina pectoris following this paravertebral block method In 22 cases relief from pain was secured in 18 He maintains that the future surgical procedures for the relief of cardiac pain must be directed to the rami communicantes found between the eighth cervical and seventh thoracic spinal segments

355. Influence of Salicylates on the Heart in Rheumatic Fever

J WYCKOFF A C DEGRAFF and S PARENT (*Amer Heart Journ* June 1930 p 568) refer to the conflicting results of previous investigations into the effect of salicylates upon the auriculo-ventricular conduction time in rheumatic fever while some workers have recorded a reduction others have observed an increase in the conduction time The present authors have therefore repeated this work upon a group of sixteen patients carefully controlled and over a long period Patients suffering from rheumatic fever and showing a PR interval over 0 2 second were electrocardiographed every day Salicylate administration was started on alternate patients (120 grains daily) after a control period of one week. All the treated patients exhibited prompt alleviation of the symptoms and a reduction of the temperature irrespective of variations in the PR interval but no definite influence upon the latter was observed In some patients the conduction time became normal in the week before the administration of salicylates in others an irregularly increasing or decreasing PR interval was observed during treatment The variations in conduction time of the patients not receiving salicylates were found to be similar to those in the treated patients The authors conclude that disturbances of auriculo ventricular conduction time during the course of rheumatic fever show wide and inconstant variations and there is no proof that they are influenced by salicylate therapy

Radiology.

356. X ray Treatment of the Sympathetic System

L DELHERM and H BEAU (*Journ de Radiol et d Electrol*, July 1930 p 331) record the beneficial results of *x* ray treatment of the sympathetic system in certain cardiovascular affections such as Raynaud's disease obliterating arteritis angina pectoris some disorders of the cardiac rhythm and slight vascular troubles associated with arterial hypertension. Illustrative cases are cited, and a brief review of the literature is appended In Raynaud's disease obliterating arteritis and other vascular disorders the following technique is adopted For affections of the upper limb, radiation is applied over the cervico-dorsal region to the second dorsal vertebra a region which includes the cervical enlargement of the cord and the cervical sympathetic ganglia for that of the lower limb the dorso-lumbar region between the tenth dorsal and the second lumbar vertebra is irradiated, this tract comprising the lumbar enlargement and the lumbar sympathetic chain It is advisable to irradiate also other fields along the vessels of the limb Two symmetrical fields on each side of the vertebral column are treated with E E 25 cm focal distance 25 cm and an aluminium filter 5 mm thick. At each of three treatments weekly 400 *r* units are given—that is 1 200 to 1 600 *r* at each site with at least three weeks interval between each series For the limbs a lesser filtration of 2 mm aluminium is permissible Two hypotheses are held to explain the effects of the *x* rays the humoral which ascribes their good effects to a modification of the suprarenal secretion and the sympathetic Delherm and Beau hold the second view and consider that the sympathetic system is at fault in their cases, and that the rays can modify its tonus They point out that the affections benefited by radiotherapy are those in which the sympathetic functioning is disordered, and that the regions irradiated contain the sympathetic medullary centres and their ganglionic centres In angina pectoris irradiations are directed over the heart and its large vessels by two fields, anterior and posterior Here, again it is concluded that the results of treatment are due to the action of the rays on the sympathetic since it is known that the angina results from hyper excitability of the cardiac plexus Similar reasons are given for the efficacy of this treatment in troubles of cardiac rhythm and in arterial hypertension

357 Sensitization to X Rays and Radium

ALLERGIC reactions of the body to various physical agents, including visible light, are well known, but little is found in the literature regarding similar effects produced by *x* rays or radium, V M MOORE (*Radiology*, August, 1930 p 262) reports a case which suggests at least the possibility that the symptoms were the result of such radiation Duke has shown that the body may be sensitized to longer wave lengths of light as well as to other physical agents It seems legitimate to expect that the shorter wave length should produce similar reactions and this case appears to be a logical sequel to the light sensitization cases of Duke except that it appears to have been produced by the shorter instead of the longer wave lengths A woman aged 52, was receiving post operative radiation for carcinoma of the left breast After intervals of thirty and twenty seven days between the last two radium treatments, two attacks occurred which were marked by suddenness of onset and angioneurotic oedema with widespread reaction (red, firm itching and swollen parts) dyspnoea pyrexia vomiting and prostration Death supervened three days after the onset of the second attack. No predisposition of the patient to allergic reactions was known but an eosinophilia persisting over several years was suggestive A severe initial dose of radiation was apparently sufficient as a sensitizing agent since the reaction was unusually severe the small final doses of radium could hardly have produced such sequels unless sensitization had already taken place Moreover, the period between each treatment and attack was about that to be anticipated following gamma radiation from radium Carter has recorded two cases with similar phenomena and Stevens has pointed out that shortly after radiation the leucocytes diminish in number and begin to return after one or two weeks In the four week period other reactions may be noted, probably due to absorption of protein matter from disintegrated cells and this may in sensitive cases result in anaphylactic shock.

358. Radiological Examination of the Appendix.

A PINOS E VIDAL COLOMER J TELLERIA, and M. CORACHA (*Rev Med de Barcelona* July, 1930) describe a modification of Czepa's method of *x* ray examination of the appendix in cases of suspected chronic appendicitis At noon on the day before the *x* ray photograph is taken the following mixture is given 100 grams of barium sulphate suspended in 350 c cm of clear gum solution to which are added 20 grams of magnesium sulphate At midnight 100 grams of barium sulphate in the gum solution but without the magnesium sulphate are administered At 9 o clock the following morning the first *x* ray photograph is taken If the appendix is invisible the procedure is repeated and the second picture is taken If the magnesium sulphate has produced no purging the dose is increased the patient should pass one or two loose stools each day The examination is sometimes completed by giving a barium enema The authors record the results of 56 such examinations 24 of the patients had no appendix symptoms and in 22 a clear picture of a normal appendix was obtained but as the two negative cases were not operated on the condition of their appendices is not known There was a clinical suspicion of chronic appendicitis in 32 cases in 18 the appendix was visible and in 11 of these a normal appendix was diagnosed Only two patients were operated on and in both this report was confirmed The remaining 7 showed *x* ray evidence of disease (filling only at the base with fixation and pain on palpation) all were operated on and appendix lesions were discovered Of the 14 cases where the appendix was not visible only 7 were operated on In 5 the appendix was macroscopically abnormal and in the other 2 histological evidence of disease was found An appendix into which the barium does not enter is therefore regarded as suspicious From the histological examination of appendices the authors conclude that there are three main reasons why the appendix does not fill (1) perityphlitis and consequent paralysis of the smooth muscle, (2) appendicitis causing obliteration of the lumen and (3) cessation of peristalsis, due to inflammatory lesions of the muscle coat causing a plug of mucus to be retained.

Obstetrics and Gynaecology.

359 Glucose in the Toxaemias of Pregnancy

W T McConnell (*Amer Journ Surg*, June, 1930, p 1263), discussing the use of glucose in pregnancy, emphasizes its value in the early toxaemias when the vomiting is due to carbohydrate disturbance, its administration assists the liver to recuperate, and the endocrine glands are enabled to adjust their functions to the new requirements Where the disturbance is of such metabolic origin the glucose treatment of hyperemesis is attended by marked benefit In the later toxaemias culminating in eclampsia glucose is effective also in lowering the blood pressure, neutralizing the toxin, and lessening the convulsions, if use is made of the "continuous intravenous drip" method, suggested by Matas and elaborated by Heudon, an average amount of 4,000 c cm of the glucose solution can be administered in twenty four hours The concentration generally used is 5 to 10 per cent, and the average duration of such continuous administration was about a week, in no case was there any untoward result The concentration of the solution was determined by the point at which glycosuria appeared, and the usual rate of administration was one drop per heart beat, the patients receiving from 1 to 2 lb of glucose daily Two thermos bottles, each of 1,000 c cm capacity, are attached by a Y tube to a Murphy drip tube, from this a single rubber tube leads to a gold plated silver cannula inserted into the vein just above the bend of the elbow By having two thermos bottles it is possible to arrange for one to be in use while the other is being filled, and the solution is maintained at a constant temperature No reactions or ill effects resulted from the administration of larger quantities by this method, and the desired results were obtained in every case

360 Late Effects of Delivery by Forceps and Version

The effects of birth injury may not be apparent in the young infant, if they appear, recovery may ensue with a return of the condition in later childhood It is thus very difficult for the obstetrician to form an opinion as to the frequency of such lesions H Krukenberg (*Med Klin*, August 8th, 1930, p 1186) has therefore conducted a "follow up" of the children in 934 cases of forceps delivery and 164 cases of version performed between 1912 and 1929 Among the forceps deliveries there were two cases of Little's disease, one of Erb's palsy, and one case of blindness, probably due to damage of the optic nerve at birth The patients with Little's disease had been discharged from the obstetric clinic as normal The child with Erb's palsy had been noted at birth, but had apparently recovered by the seventh day, on re examination at the age of 4½ the arm was found to be useless The version deliveries had given rise to six cases of birth injury, three being cerebral, two due to brachial plexus damage, and one due to fractured femur (with 4 cm shortening at the age of 10 years) Krukenberg considers his cases too few to indicate the frequency of such injuries, but he calls attention to the life long disability resulting therefrom.

361 Hernia of Ovary and Fallopian Tube

C P G Wakeley (*Surg, Gynecol and Obstet*, August, 1930, p 256) discusses hernia of the ovary and Fallopian tube, and reports twenty five cases About 90 per cent of the other cases recorded in the literature were of the inguinal variety, and only three of Wakeley's series were femoral In inguinal hernia of the ovary it is usual to find the Fallopian tube also, whereas in the femoral variety the ovary is usually present alone The majority of cases occur in patients under the age of 1, since the ovary does not generally descend into the pelvis until the end of the first year Later the condition usually occurs in multiparae owing to the greater mobility of the ovary and tube In young children the ovary may appear at the external ring or in the labium majus as a rounded and freely movable swelling, which is not tender, in adults however, it is hypersensitive and painful, and there is a history of enlargement at each menstrual period Torsion and strangulation are the most frequent complications, especially in young children Since the application of a truss is rarely effective, and may result in atrophy with cystic or degenerative changes, an operation affords the only effective method of treatment, the ovary and tube being returned to the abdomen and the hernial sac being excised When, however, torsion or strangulation has occurred excision should be performed, since a useless fibrotic ovary always results from this accident The present author's twenty five cases occurred in a series of 303 inguinal and 200 femoral hernias operated upon during the past ten years

Pathology.

362. Action of the Anterior Pituitary Hormone

The effect of the anterior lobe of the pituitary in controlling sexual development has long been recognized, but most of the experimental work in this field has related to its effect on the female sex organs Thus Zondek, who prepared a water soluble preparation of the anterior pituitary hormone, known as "prolan," was able to produce precocious puberty in female animals H Bolters (*Deut med Woch*, August, 15th, 1930, p 1382) now records the effect of the subcutaneous administration of this preparation on infantile male rats. He states that he has been able to produce rapid development and maturation of the testis, with increase of interstitial tissue, but not, however, the formation of ripe spermatozoa The other sex organs (prostate, vesiculae seminales) also show definite enlargement The actual body weight of the animals so treated was less than that of the controls He thinks it is thus established that this preparation has an effect on the sexual development in the male as well as in the female, but that the testis appears to be more resistant to its action than is the ovary Boeters points out, however, that "prolan" is at present prepared from the urine of the gravid female, he thinks it possible that its effect on the testis might be more pronounced if it was prepared from the male animal

363. Differentiation of Brucella melitensis and Brucella abortus

G Favilli (*Lo Sperimentale*, August 12th, 1930, p 287) has studied the sulphur metabolism in 103 strains of Brucella He finds that the varieties of this organism cultivated on liver agar do not all produce the same amount of hydrogen sulphide With *Br abortus* isolated from cattle and swine there is considerable production, but strains of *Br melitensis* and *Br paramelitensis* isolated from goats, sheep, and men produce no sulphide of hydrogen, or only a very small amount The strain *Br abortus humani*, isolated from men infected with undulant fever from cattle and swine suffering from epizootic abortus, gave a good production of H_2S in the same degree as that originated by *Br abortus* The author concludes that a study of the amount of hydrogen sulphide which individual strains of Brucella are able to produce is the best up to date means of differentiating the various qualities of these bacteria

364 Mercury Poisoning

Acute mercurial poisoning is a well defined syndrome, with characteristic history, symptomatology, laboratory findings, and pathological picture, but a history is not always available, and in such cases, which are rare, mercury may never even be suggested When it is, its consideration may be submerged by more common syndromes which closely simulate it P F Shapiro (*Journ Lab and Clin Med*, July, 1930, p 961) describes two cases (one acute, the other subacute) of fatal mercury poisoning, in which lack of history was the chief diagnostic handicap This led readily to an incorrect interpretation of the clinical symptomatology which, in retrospect, was typical of an acute or a subacute poisoning So remote was the suspicion of mercury that no chemical examination was made Histological examination revealed the diagnosis in both cases, and demonstrated the extreme activity and rapidity of regenerative changes in mercury nephrosis This lively regeneration is more specific for mercurialism than is calcification, which was slight or absent in both cases The pathogenesis of mercury nephrosis is reviewed Attention is called to the fact that when calcification fails to appear inflammatory reaction in the kidneys is likewise absent There is then no interstitial infiltration nor insufficient hyperaemia to produce the typical red sublimate kidney of the third stage of the nephrosis Both the cases described lacked this inflammatory reaction, and are examples of the less frequent brown sublimate kidney

365 Leptospira Icterohaemorrhagiae Infection in the Dog

G Korthof (*Nederl Tijdschr v Geneesk*, August 11th, 1930, p 4097) states that spirochaetosis icterohaemorrhagica in dogs may assume one of two clinical forms—namely, either uraemia or jaundice, accompanied by fever diarrhoea, and haemorrhages, like Weil's disease in the human subject Dogs often become infected with *Leptospira icterohaemorrhagiae*, especially with advance in age, so that old dogs are more commonly infected than not This infection, however, is not associated, as in rats, with the invasion of the kidneys by the leptospirae and their excretion in the urine, and consequently canine infection is not dangerous to man

PERCAINE "CIBA"

Trade Mark Registered

The New Local Anæsthetic for Regional, Infiltration, Surface and Spinal Anæsthesia

Acts in extreme dilution (0·5—2 1000)
Produces anæsthesia of unattained intensity and duration.
Not a narcotic. Economical in use.
Belongs chemically to a class entirely different from cocaine and its derivatives

Vide *British Medical Journal* March 15 1930 pp 488-9 and 495-6 and April 5 1930 pp 669-70 *The Lancet* March 15 1930 pp 573-4 and 587 *British Journal of Anæsthesia* April & July 1930 *Proceedings of the Royal Society of Medicine* May 1930 pp 919-928 *British Journal of Urology* June 1930 pp 129 130 and 179

Success achieved entirely as the result of professional recommendation is no matter of chance, but must result from satisfactory experience and from the scientific accuracy of the medicament Ostomalt (Ostelin, malt extract, and orange juice) is a dependable source of vitamins A, B, C and D, for four years it has enjoyed the increasing confidence of a large and growing body of practitioners

The control exercised over the manufacture of Ostomalt, expressed in consistent results, has appealed to the medical profession, just as its palatability and efficacy have appealed to the patient. Ostomalt and 'tonic' are synonymous—its indications are virtually unlimited Whether your patient is infant, youth or adult, debilitated, convalescent, or merely run-down, Ostomalt will serve you well

Is it made from St. Wolstan Wool?

—a *material* consideration when buying underwear

For protection see that the underwear you buy is made from St. Wolstan Wool for none but the most carefully picked pure botany ever bears the name. Such is the material of Two Steeples St. Wolstan Wool Underwear. And as befits wool of such good quality it is skilfully knitted into garments which fit as only correctly fashioned underwear will. Comfort thus is doubly sure in

Vols I and II of the BRITISH MEDICAL JOURNAL for 1930 and previous years can be had, price 2s 6d by parcel post 2s 10d each

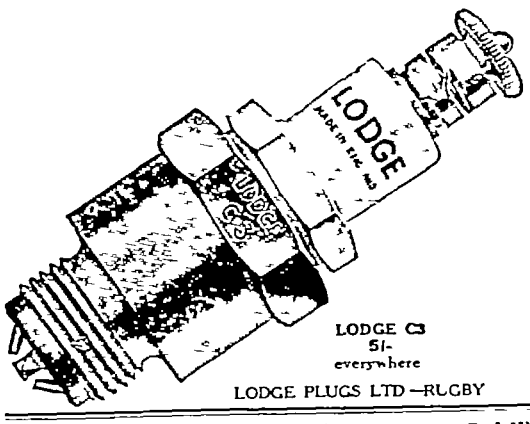
Remittances must accompany all orders Apply at the office B M A House Tavistock Square, W C 1

Advertising Helps the Reader

Readers of the Journal are presented week by week with a comprehensive summary of products necessary to the medical man both in his professional and private life The advertisement pages of the Journal are carefully scrutinised before going to press, in order that our readers may deal confidently with those firms whose announcements win their interest and attention

Modern advertising seeks to increase demand, thereby stimulating production and building a circle of prosperity, which ultimately reacts to the advantage of the purchaser himself Advertised products necessarily maintain a high standard of excellence, for disaster must naturally come speedily to the manufacturer who through any cause and at any time loses the confidence of his customers

It is the policy of the Journal to convince advertisers that doctors prefer to be approached directly through the pages of their own publication, for in this way we believe manufacturers are encouraged to consider the special needs of the profession, and to state clearly the results of their efforts to meet these requirements when seeking orders from medical men



The "small" advertisements section provides a *forum* for the "domestic business of the profession, and those wishing to arrange the Sale or Purchase of Practices, requiring Assistants or Assistancies, and Partners or Partnerships, may in these pages reach thousands of their fellow medical men at very economical cost Such transactions may, in addition, be protected by the secrecy which the free Box Number service provides

THE TREATMENT OF **GOUT**

PISTANY

RADIO ACTIVE MUD PACKS

PISTANY SPA REPRESENTATION
38 Sackville Street W 1 Tel. Gerrard 1238

Pistany (Czechoslovakia) offers the most effective treatment for the cure of gout

Special provision is made for the diet of gouty patients in the hotels.

In mild cases a few weeks suffice to relieve the condition but the need for prolonged intermittent treatment often makes a course with Pistany Mud Cubes or Compresses at home, under the patient's own doctor's supervision indispensable for a complete cure

The method of application is safe and inexpensive for Pistany's sulphur Mud is inert and sterile of mineral content and keeps indefinitely

Send for interesting Medical and Tourist literature.

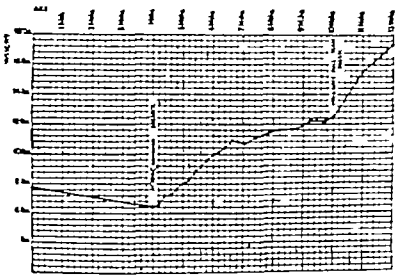
NATURALLY RICH

IN VITAMIN "D"

A "RESURRECTION"

GUILDFORD
30 6 30



"Baby Hook, came under my care shortly after birth suffering with marasmus following whooping cough Broncho-pneumonia developed and was with great difficulty cleared up, leaving the child in a very low condition Feeding proved a difficult problem, several things were tried without beneficial results The results with Cow & Gate were truly wonderful, indeed it is a case of 'a resurrection'"

(Signed)..... M.B Ch B

Lacidac (separated) and Brestol, the Cow & Gate Humanised Cream, were used in the early days of treatment. Cow & Gate Full Cream and Brestol being used subsequently.

BEFORE—4 months' old, 6 lbs. 9 ozs. in weight.

Progress Chart

AFTER—10 months' old, 12 lbs. 6 ozs. in weight.

June 1930 Baby Hook has now won a prize in a Baby Competition!

Write for literature and clinical samples of Lacidac and Brestol.

J. & A. CHURCHILL

THREE GREAT FAVOURITES

SURGERY

3 EDITIONS IN 3 YEARS

716 Illustrations Two Volumes
28s, postage 1s 3d

ROMANIS & MITCHINER

A well balanced account of the Science and Art of Surgery as practised at the present day A student preparing for a pass examination in Surgery need not buy a number of books dealing with the different branches If he absorbs the information contained within the covers of these volumes he will certainly satisfy the examiners and will moreover have acquired a very good basis of knowledge for higher degrees in Surgery the authors are to be congratulated a very useful and practical manual for the undergraduate student The price is very moderate —*The Lancet*

PHYSIOLOGY

RECORD SALES THIS YEAR

5th Edition 543 Illustrations
21s, postage 1s

STARLING & LOVATT EVANS

Professor Lovatt Evans has accomplished his difficult task with complete success Every chapter bears some sign of having been weighed judicially and remodelled to the better proportion of the whole Elimination of matter now redundant insertion of new material whose importance has grown in recent years reorientation of argument for the better progress of the story have all contributed to a book which will have few competitors The qualities of authority understanding and vitality combine to preserve Starling's Principles as a completely satisfying work —*British Medical Journal*

MEDICINE

ONLY 25s.

64 Plates (12 Coloured) and 103 Text-figures

Edited by E. P POULTON M.D., with the Assistance of C. P SYMONDS M.D., H. W. BARBER, M.B and R. D GILLESPIE, M.D

TAYLOR & POULTON

This popular text book now in its fortieth year well maintains the reputation of the great school of Guy's Hospital The Editor must be congratulated on the success of his labours and on the up-to-date character of this valuable book —*The Practitioner*

The VERY LARGE SALES enable LOW PRICES for these STANDARD WORKS.

CANCER OF THE LARYNX

By Sir STCLAIR THOMSON, M.D, F.R.C.P., and LIONEL COLLEDGE, M.B., F.R.C.S.

Cancer of the larynx is a subject which Sir StClair Thomson has made his own He has so developed the technique of the operation of laryngofissure that it has become as safe in his hands as any major operation can be He also exposes the error that intrinsic cancer commonly arises in the posterior half of the larynx, and shows that lack of mobility of a cord is not an early sign of cancer This is a magistral exposition of a great subject

DOCTORS CHINA TEA

WHY IT IS PRESCRIBED FOR GASTRIC PATIENTS

When ordinary tea is out of the question it is essential that only really good China should be drunk The Doctor's China Tea has won the enthusiastic approval of practitioners simply because it is a perfect blend of a good China leaf with all excess tannin eliminated It can therefore be prescribed for invalids and dyspeptics with safety—it has no ill after-effects

HYPERTENSION AND NEPHRITIS

By ARTHUR M. FISHBERG, M.D., Adjunct Attending Physician to Mount Sinai and Montefiore Hospitals, New York City.

☞ The purpose of this work is to depict our present knowledge of the heterogeneous group of diseases traditionally included in the concept of Bright's disease. The book is written primarily from the point of view of the actual practice of medicine and it aims to summarize for the practitioner all the information that practice, clinic, and laboratory have yielded regarding the hypertensive and renal diseases.

Size 6 × 8½ Pp. xvi + 206 with 43 Illustrations and 1 Coloured Plate Price 16s postage 9d abroad 1s

TUBERCULOSIS AMONG CHILDREN

Its Diagnosis, Treatment, Prognosis and Prevention

By J. ARTHUR MYERS, Ph.D., M.D., F.A.C.P., Chief of Medical Staff, Lymanhurst School for Tuberculous Children, Associate Professor of Preventive Medicine, University of Minnesota.

☞ Such a book is heartily to be commended as the general practitioner and for the senior medical student. It gives quite the best review of our present conception of tuberculosis infection among children which the reviewer has seen, and is a rich mine of information.
—CANADIAN MEDICAL ASSOCIATION JOURNAL.

TRUDEAU FOUNDATION STUDIES.

SECOND EDITION Thoroughly Revised. Pp. 304 with 2 Coloured Plates and 122 other Illustrations Price 21s postage 6d. abroad 9d.

INTESTINAL TUBERCULOSIS

Its Importance, Diagnosis and Treatment. A Study of the Secondary Ulcerative Type.

By LAWRASON BROWN, M.D., Consultant to the Trudeau Sanatorium, Saranac Lake, New York, and HOMER L. SIMPSON, Roentgenographer of the Trudeau Sanatorium, Saranac Lake, New York.

Size 5½ × 8 Pp. viii + 596 Price 15s postage 6d abroad 9d

HANDBOOK OF DISEASES OF INFANTS AND CHILDREN

By F. M. B. ALLEN, M.D., M.R.C.P. Lond., Assistant Physician to the Belfast Hospital for Sick Children, Physician in charge of Infants, Belfast Maternity Hospital, Lecturer in Materia Medica and Therapeutics, Queen's University of Belfast.

☞ An account of the subject of infant feeding and the diseases of children written in the light of modern knowledge and practical experience.

Size 5½ × 8½ Pp. xii + 203 Price 10s 6d postage 6d. abroad 9d.

PSYCHOPATHOLOGY

A Survey of Modern Approaches

By J. ERNEST NICOLE, L.M.S.S.A., D.P.M.R.C.P. & S., Senior Assistant Medical Officer, Lancashire County Mental Hospital, Winwick, Honorary Secretary Psychopathology Sub-Committee Royal Medico-Psychological Association, Late Assistant Medical Officer County Mental Hospital, Prestwich, etc., etc.

With Foreword by W. H. B. STODDART, M.D., B.S., F.R.C.P. Lond.

☞ This book is intended to fill the gap which exists between the text-books of physiology and psychopathology on the one hand, and those of psychiatry on the other, without itself aspiring to be either.

TENTH EDITION Pp. xxii + 536 with 6 Plates and 279 Illustrations. Price 25s postage 9d. abroad 1s 3d.

PHYSICAL DIAGNOSIS

By RICHARD C. CABOT, M.D., Professor of Clinical Medicine in Harvard University, formerly Chief of the West Medical Service, Massachusetts General Hospital.

MICKLEFIELD IRRADIATED MILK

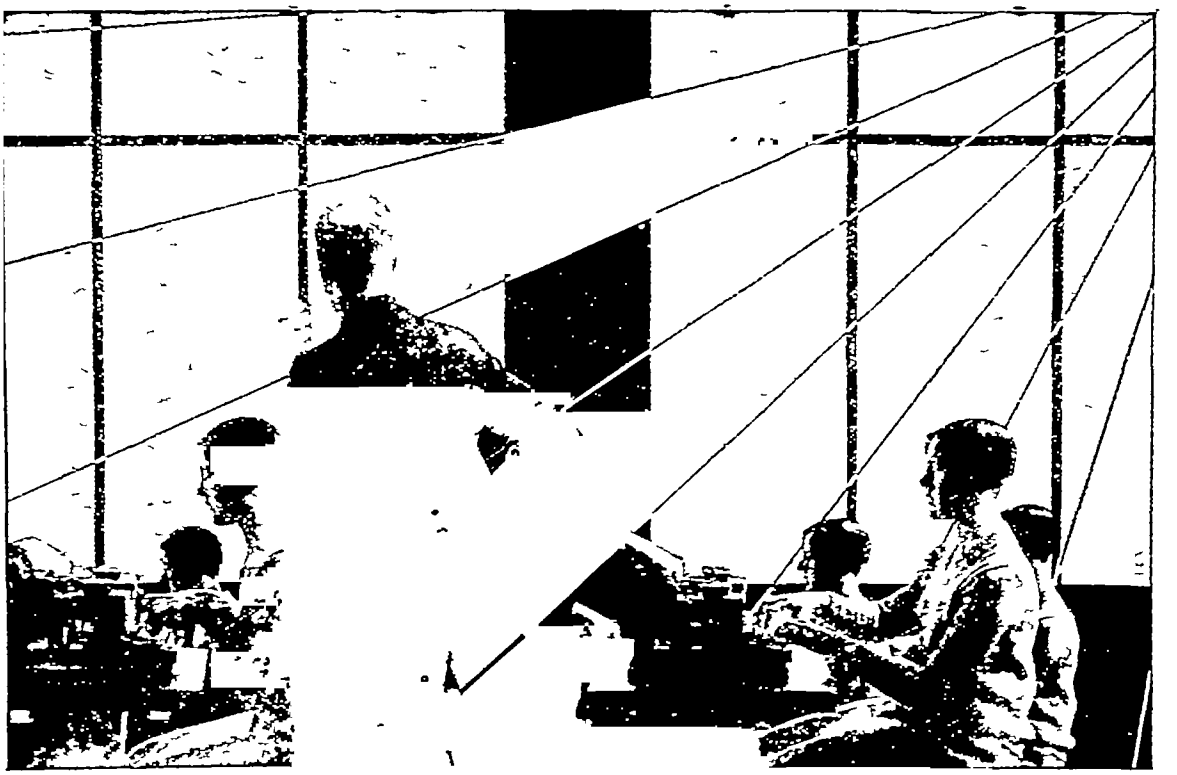
TREATING THE MILK

By this Process—

(1) VITAMIN A AND NATURAL FLAVOUR ARE PRESERVED
(2) VITAMIN D CONTENT IS INCREASED 1,800 PER CENT.; OR TEN TIMES THAT OF ANY OTHER IRRADIATED MILK

One pint equivalent in Vitamin D to 600 drops or 12 grammes of average Cod-Liver Oil

A ten weeks test recently conducted at the Infants School Rickmansworth under the supervision of the Medical Officer of Health, gave the following results —



(1) 18 children (controls) had their usual ordinary milk
(2) 29 1/3 pint of Grade A (T T) milk five days a week
(3) 30 Micklefield

(1) Average increase in height 605 in (2) Average increase in weight 9 72 ozs more than (1)
(2) 610 in (3) 10 9 ozs more than (1)
(3) 744 in

Full particulars appeared in an article in the LANCET, January 18, 1930, p 127, et seq, a reprint of which will be sent post free on request

The milk is delivered every week-day in London, elsewhere by arrangement.

Write to J O. HICKMAN, MICKLEFIELD GREEN, RICKMANSWORTH

"COME IN, COME IN!"

Slowly the facts emerge after years of doubt Now we can say, with proof ready at hand, that the health rays are present in outdoor light on fine days, dull days, wet days, and sometimes even on foggy days

The National Physical Laboratory is making an investigation to show the wave-lengths of the ultra-violet rays detected daily throughout the year July 1929/1930 An interim report covering July to the end of November has been published Certain weather conditions such as snowstorms and thick yellow fog have not yet been recorded, but every day up to the end of November wave-lengths well down in the health band have been detected. The record includes all wet days, days with overcast skies and even one day on which there was "a fairly thick white fog

These rays must not be wasted They can be brought indoors through "Vita" Glass windows at a very small extra cost now that the prices of "Vita Glass have been reduced. It is an actual fact that there is more of the valuable ultra-violet light in a room fitted with "Vita" Glass on a dull November day than in a room fitted with ordinary window glass on the brightest day in summer

Write for a copy of the National Physical Laboratory's report and full particulars of "Vita Glass to the "Vita" Glass Marketing Board, 9 Crown Glass Works, St Helens, Lancashire.

'Vita Glass is obtainable from local Glass Merchants Plumbers Glaziers and Builders

SCIENTIFIC DIETETIC DETAILS

Recent advances in diet therapy have led to the complete reversal of earlier methods—the almost total exclusion of starch from the dietary of diabetic patients is now recognised as fundamentally wrong The modern dietetic treatment of diabetes demands that bread and other farinaceous foods shall contain carbohydrates up to, but not in excess of, the ascertained degree of tolerance, whether Insulin is used or not Indeed, in all disorders of the alimentary tract, from whatever cause, an adjustment of the protein and carbohydrate on defined and accurate lines is admittedly essential

Energen starch-reduced and protein-increased products enable the physician to prescribe definite proportions of carbohydrate, protein, and fat to patients suffering from Indigestion, Rheumatism, Obesity, and similar complaints, the composition in grams and the total calorie value being stated on every packet

A sample packet of BISMEAL the balanced Energen Breakfast Food sent post free.

Dietetic monographs diet tables for diabetes—revised in accordance with the recent report on the Carbohydrate Content of Foods prepared for the Medical Research Council (Privy Council) by McCance and Lawrence—diet tables for obesity and light diets and samples will gladly be furnished to Members of the Medical Profession

WHEN VITALITY IS LOW, THEY STIMULATE AND CREATE A DESIRE FOR SOLID FOOD

BY APPOINTMENT

A RECENT investigation revealed that as many as 99 *out of every* 100 doctors interviewed are recommending Brand's Essences for their patients in serious illness and convalescence

Consisting only of the pure essences of the finest fresh meats, conserved in their natural form, they can be rapidly absorbed without the slightest strain on the digestion No substances are added which would prevent easy assimilation, such as colouring matter, gelatine, or preservatives

During that period in serious illness when a patient's vitality is at its lowest, these Essences never fail to restore energy quickly

And in convalescence, when the very idea of food is repugnant, Brand's Essences bring back the appetite — prepare the patient for more solid diet

Brand's Essences are obtainable at chemists and stores throughout the world in small and large-sized tins and glasses Samples will be sent you gladly on receipt of a professional card Write Dept F15, Brand & Co Ltd , Mayfair Works, Vauxhall, S W 8

A letter recently received

The Medical Adviser of Messrs Kaylene Ltd,
London

Dear Sir,

The case to which I referred was a child of six months who was brought to me after having treatment elsewhere for diarrhoea and vomiting The child was practically a skeleton and apparently had been vomiting everything—even medicines—for many days The mother thought and her friends thought, the child was dying, and I happened to be the nearest doctor I gave the child one teaspoonful of plain Kaylene in plain, cold, boiled water, and kept the mother and child in my consulting room to watch effects If ever a child was drawn from the jaws of death I think that little sufferer was The Kaylene was retained, the gasping steadily lessened, the haunting look of that child's eyes became less distressing, in fact, the change for the better was so pronounced that in an hour's time I allowed the mother to take the child home

Fortunately I had sufficient Kaylene by me (a sample you kindly sent), and I gave the mother sufficient to give a teaspoonful every hour during the night The chemists' shops were all shut by this time I gave full instructions—strict instructions—not to give anything else but Kaylene and plain, cold, boiled water as I had done

In the morning the mother came to see me and informed me that only twice during the night the child had loose stools but no vomiting and had slept fairly well The child had other two loose motions during the day, but not offensive ones like all the other stools In the evening the child cried—the first time for two days—and as she looked, and was, so much better, I gave her some white of egg with plain cold boiled water Still improving, I kept her on this for three days She was doing well and I then allowed her milk She made a complete recovery, and there can be no doubt whatever that Kaylene saved the child's life

Yours faithfully,

, M B, C M

A Distinct Advance Over Preparations of Acetyl-Salicylic Acid

Acetyl salicylic acid possesses a notable disadvantage Physicians have proved that it cannot be tolerated by patients suffering with a delicate stomach Consequently, the value of this medicament in the wide field in which it is indicated is very seriously reduced

"Alasil" completely overcomes this objection By combining calcium acetyl-salicylate with 'Alocol," unfavourable secondary action upon the stomach is prevented This beneficial influence is undoubtedly due to the presence of "Alocol" (Colloidal Hydroxide of Aluminium), which preparation has brilliantly stood the test of practice in the treatment of hyperacidity and other ill conditions of the gastric tract "Alasil" is therefore a triumph over acetyl-salicylic acid It enables higher doses to be administered and maintains the patient's system under its influence for a greater length of time Analgesic, Antipyretic and Sedative, "Alasil" is indicated in all cases where acetyl salicylic acid has been used heretofore

Important Announcement

H. K. MULFORD COMPANY LTD

We take pleasure in announcing that the above Company will hereafter be known as

SHARP & DOHME LTD.

This change of name is due to the amalgamation of the SHARP & DOHME COMPANY with the H K MULFORD COMPANY We believe the fusion of these well-known firms will afford our many friends among the Medical and Pharmaceutical professions the same satisfaction as it affords us *inasmuch as while we shall continue to distribute the well known Biological and Pharmaceutical Products manufactured by the H K MULFORD COMPANY we shall also manufacture and distribute the Pharmaceutical specialties of Messrs SHARP & DOHME*

The business of SHARP & DOHME Ltd will still be conducted upon the professional basis as heretofore by eliminating monopoly obtained by secret formula, by publishing formula on all labels, stating all medicinal ingredients and amounts thereof in each preparation, and by accurate statements in advertising

Furthermore, the advantages which we shall derive from the combined research laboratories of the two Companies will enable us to participate in the improved processes and methods of manufacture, standardization and discovery of new therapeutic agents

SHARPE & DOHME LTD.

Infections of the Naso-Pharynx

In these latter days of medicine when people expect the profession to recommend something simple to keep them well rather than take mixtures when they are ill, a preparation which can prevent infection of such an important area as the naso-pharynx should appeal to every practising physician, and especially to Medical Officers who are responsible for the safeguarding of the health of great numbers of children

The following extract from a recent report speaks for itself with regard to the value of Dimol Snuff—its potency and reliability—in cases of diphtheria carriers, and what has been found a practical solution for the elimination of this troublesome bacillus should be as applicable to the Pneumococcus, Bacillus influenzae, Meningococcus, Micrococcus catarrhalis, etc —

> We are getting very excellent results with Dimol Snuff in the treatment of diphtheria carriers (12 weeks positive cultures) and pre-carriers (6 weeks positive cultures) the latter of course with the idea of preventing them reaching the carrier stage
>
> Taking both classes together we consider that we have been successful in about 90% or more cases
>
> Most of the failures we find due to some definite chronic nasal disease
>
> As a routine we use Dimol Snuff twice a day with an insufflator If a failure occurs and it is apparently the nose itself and not a question of adenoids then we increase the treatment to six times a day The children do not appear to suffer any harm from the powder even in these extreme doses
>
> The treatment is continued until the child has had negative swabs twice a week for 3 weeks and then another 3 weeks without snuff
>
> One more point which is established is that dirty noses are all cleared up with one exception in this case I suspect an antrum and shall examine him for such as he is a big boy —— I R C S

Children can be taught to take the snuff easily and efficiently in small pinches

Samples will be sent on application to

Dimol Laboratories, Limited, 40, Ludgate Hill, London, E C 4

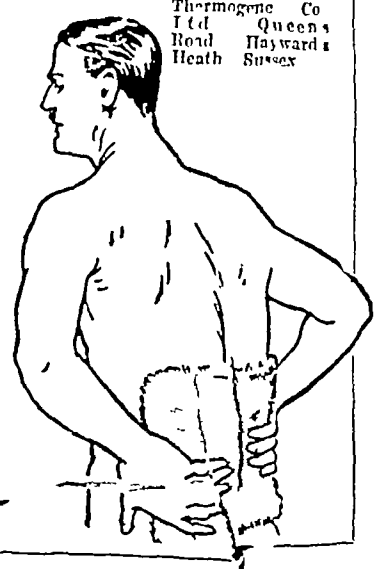
SANGERS LTD, 258 EUSTON ROAD, LONDON N W 1



The Relief of "Rheumatic" Pains

Dr Guntzburg, the Medical Superintendent of the Physiotherapeutic Institute of Antwerp, states that *in practically all so-called "rheumatic" cases a pronounced degree of peripheral circulatory failure is symptomatic*, and he says that the *skin condition is* "the immediate factor in the production of rheumatic pains" This is in accord with the emphasis laid at the recent Bath Conference on the part played by damp and cold in promoting neuritis and fibrositis

Thermogene relieves pain by hastening the skin circulation, and so helping the removal of irritating waste products and the re-oxygenation of de-oxydised tissues

The time to use Thermogene is when the very first twinge is felt By its timely employment many an attack may be warded off

Thermogene is a carefully prepared pure cotton wadding, remarkably soft and fleecy, freed from dust and other impurities, and impregnated with skin-stimulating vegetable essences

A full size box of Thermogene with an Interesting booklet on Surface Therapy will be sent FREE to any medical man who is unfamiliar with Thermogene and its many uses in practice The Thermogene Co Ltd Queens Road Haywards Heath Sussex

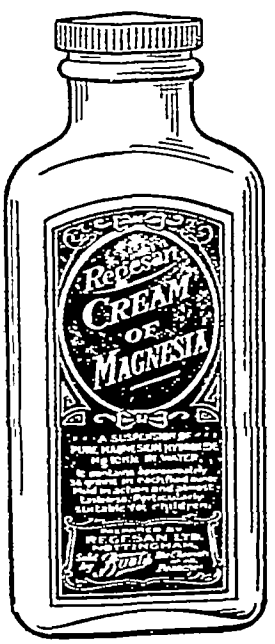
MEDULLA RUBRA

BONE-MARROW IN ANAEMIA FROM HAEMORRHAGE

W B rchardt (*Deut med Woch* March 28th 1930 p 521) record the results of his experiments on young dogs in which anaemia had been artificially produced by th removal o about half their blood In th first series some of the animals were fed with rib-marrow others with marrow from the long bones Control animals received a corresponding amount either of fat or of liver extract The basal diet in each case contained a sufficien t of iron (5 mg per cent). Only the animals receiving the red rib-marrow showed a definite increa e of weight and their haemoglobin formation was more rapid than that of the others. In the next series the experiment was repeated but the iron content of the diet was reduced to 1 4 mg per cent The result was similar but more striking the dogs receiving the rib-marrow regaining their haemoglobin far more quickly than the others.

THIS extract from the "Epitome of Literature" published in the 'BRITISH MEDICAL JOURNAL,' dated May 3rd last is important as representing in 1930, a complete justification of the formula upon which



Roboleine
THE FOOD THAT BUILDS THE BODY

has been produced without variation during the past twenty five years

The success of ROBOLEINE is thus due to intelligent anticipation and to consistently maintaining the highest possible standard of manufacture.

Medical Practitioners are asked to satisfy themselves of the merits of ROBOLEINE for which purpose testing samples will be gladly sent upon request.

CREAM OF MAGNESIA

A pure, finely divided Magnesium Hydroxide ($Mg(OH)_2$) suspended in water A simple antacid and valuable laxative. Digestive troubles and gastric conditions indicating the necessity of a corrective of this type quickly respond to treatment with Regesan Cream of Magnesia.
It does not gripe nor cause discomfort, and is mild in action.

Prices 1/3 and 2/3 per bottle

PHYSIOLOGICAL TREATMENT OF CONSTIPATION

Total extract of the glands of the intestine Biliary Extract-Agar-Agar-Selected Lactic Ferments

VAXOL

LABORATOIRES REUNIS LOBICA, 46 Avenue des Ternes PARIS

Alimentary Toxæmia and Neurasthenia

NEURASTHENIA is no doubt a comprehensive term which includes several affections of different ætiology

Intestinal Disinfection

In many of the cases alimentary toxæmia plays a considerable part the digestion is upset and flatulence is frequent the bowels are fickle in their action, and the indican and ethereal sulphates in the urine are markedly increased—sure signs of putrefactive changes in the bowel

In this class of cases intestinal disinfection is one of the principal lines of treatment to be adopted, and for this purpose nothing surpasses the use of Kerol Capsules

For intestinal disinfection, use KEROL CAPSULES (keratin coated), they contain 3 minims of Kerol One to three capsules may be given three or four times a day after meals

Kerol Capsules

A formula that demonstrates its scientific value

Salvitae

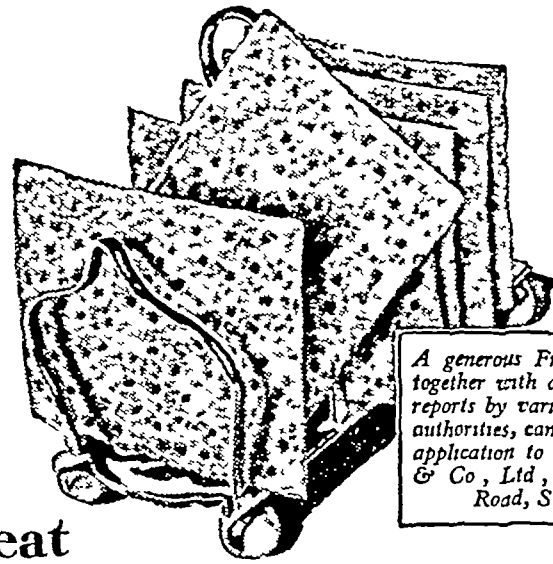
Two sizes, 4/6 and 7/-

Manufactured by American Pharmacal Co., New York

Gastritis, Gastric and Duodenal Ulcer

That BiSoDoL is a therapeutically sound preparation will be readily appreciated from its formula

BiSoDoL is a balanced combination of the Sodium and Magnesium bases with Bismuth Subnitrate, Carica Papaya, Malt Diastase, and Mentha Piperita



BiSoDoL supplies a convenient and agreeable product for the treatment of gastro-intestinal conditions associated with hyperacidity. It is a valuable preparation for allaying such digestive symptoms as eructations, flatulence, distension and nausea

BiSoDoL is also giving excellent results in the alkaline treatment of gastritis, and of gastric and duodenal ulcer as well as in the control of cyclic vomiting, and the morning sickness of pregnancy In the latter the effect of BiSoDol has been especially noteworthy.

BiSoDoL

Samples will be gladly sent to Physicians on request.

Vita-Weat
prescribed in place of ordinary bread

A most agreeable and beneficial alternative to soft wholemeal or white bread, especially in cases where a diet regime is prescribed, is to be found in Vita-Weat, the British whole wheat crispbread

Vita-Weat presents the whole wheat berry in a *concentrated and digestible* form, with the Vitamins A, D and B in an active condition

The *Practitioner*, reporting on Vita-Weat in August, 1927, said "The value of this crispbread is not only in the vitamins it contains, but because it requires thorough mastication, while the branny scales serve *as a corrective to intestinal inertia*"

The *Lancet*, in its report on June 11th, 1927, vouched for Vita-Weat in the following terms "It will be noted that the caloric value is high" (The *Lancet's* own calculation was 1,846 per lb) "It has a pleasant texture and flavour It is undoubtedly a valuable foodstuff, more particularly in respect of its content of Vitamin B"

The Royal Institute of Public Health report, printed in the *Journal of State Medicine*, Vol XXXV, No 8, stated that "Vita-Weat crispbread contains all the necessary elements and possesses a good physiological fuel value," and further said that the special method of manufacture "gelatinises the starch grains and thoroughly disintegrates the cellulose, fibre, etc, of the grain, *thereby rendering the finished product completely assimilable*"

These valuable testimonials show that the regular use of Vita-Weat will promote health, vigour and physical fitness

TONIC RESTORATIVE—INVALUABLE IN CONVALESCENCE

The new Blood Enriching Vitamin Food

SAVORY & MOORE'S TRADE MARK SOLUGA

Concentrated Nerve Food of Organic Origin.

Prepared under strict scientific control

INDICATIONS

All Vitamin deficiency diseases

Convalescence

Over Fatigue

Nervous Exhaustion

and all similar conditions

SOLUGA is an Organic Food containing in definite proportions Hormones Albumins and Lipoids derived from the Liver Heart Brain Thymus and Central Nervous System with Vitamins A B D, & E in stable form In addition biologically active iron lime and phosphorus are present with Bulgarian Yoghurt recommended by Metchnikoff

May be safely prescribed for Nursing and Expectant Mothers and for Delicate Children

SOLUGA (Dry) incorporates the latest discoveries in the study of dietetics Not only does it provide calorific energy, but contains in an easily assimilable form Vitamins, Hormones, etc, which regulators are necessary to the continued functioning of the body The presence of Yoghurt has an excellent effect on intestinal activity and is to be recommended in cases of abnormal intestinal fermentation

Soluga as an accessory Food is an invaluable adjunct to various strict diets in the treatment of stomachic and intestinal diseases Its sharp taste relieves the tedium of dietary treatments deficient in common salt

ANALYSIS.

SOLUGA (Dry) contains

Blood forming Hormones (extract of calf's liver and red bone marrow)	per cent	6
Regenerating Hormones (extract of thymus gland)	,, ,,	2
Nerve forming substance (extract of the central nerve system	,, ,,	2
Glucose	,, ,,	50
Galactose	,, ,,	5
Albumins of high biological value (tryptophane etc)	,	20

THE RATIONALE OF THE ACTION OF RYVITA CRISPBREAD IN CERTAIN SPECIAL CONDITIONS

DIABETES

Many doctors now prescribe Ryvita for diabetic patients instead of the bread substitutes on which they were formerly dependent In most cases carbohydrate tolerance can be maintained when Ryvita is substituted for all other forms of bread and cakes

We need scarcely stress the value of such a bread as Ryvita to Diabetic sufferers, where it can be tolerated It helps very substantially to maintain the general nutrition of the patient, and to regulate the bowels It is much more satisfying than ordinary diabetic breads, and much more palatable It has thus proved a very great boon to many sufferers

Ryvita is made of pure, crushed wholegrain rye It is balanced by its own B Vitamin, since the structure of rye grain prevents the germ being lost in the milling, as it so often is from wheat or oats Ryvita is rich in the natural organic salts of iron, phosphorus, and lime

Ryvita is definitely indicated as an item of the dietary in treatment of disorders arising from digestion, constipation, or malnutrition It is usual to suggest that the patient begin by eating two or three slices of Ryvita with at least one meal each day

RYVITA

CRISPBREAD

We shall be very pleased to send Free Samples and special diabetic particulars to any interested Member of the Profession

The Harveian Oration

ON

THE BIRTH OF CHEMICAL BIOLOGY

DELIVERED BEFORE THE ROYAL COLLEGE OF PHYSICIANS OF LONDON, ON OCTOBER 18TH, 1930,

BY

J. B. LEATHES, F.R.C.P., F.R.C.S., LL.D.,
PROFESSOR OF PHYSIOLOGY, UNIVERSITY OF SHEFFIELD

We meet here on St. Luke's Day to honour the wish of William Harvey and to carry out the terms of the deed of gift which he assigned to the College in 1656. Harvey's wish, you remember, was that there should be once every year a commemoration of all the benefactors of the College, and that this commemoration should keep alive in us the desire "to imitate these benefactors, to contribute our endeavours for the advancement of the society according to their example, and to search and study out the secrets of Nature by way of experiment."

HARVEY'S BENEFACTIONS

In any such commemoration we cannot but remember the many ways in which Harvey himself was a benefactor of the College. For fifty years a Fellow, he served as *treasurer for many, down to 1629, for forty years* he was Lumleian lecturer in anatomy and surgery, to which post he was appointed in 1615, at his own cost he built for the College "a great parlour or convocation house for *the Fellows to meet in*" with a *library* and museum above it which was opened in 1653 with a ceremony sumptuously provided by himself. This hall was built apparently over the court or garden of the premises at Amen Corner, which recently by the *generosity* of Dr. Harvey had been bought for the College. Here, in the year before Harvey's gift, the College had set up his statue.

When Harvey first became a Fellow in 1607, the College meetings were still held at Linacre's house in Knightrider Street, as they had been since 1518. But in 1614 the rooms at Amen Corner were rented from the Chapter of St. Paul's, and thirty-five years later Dr. Harvey relieved the College of the burden of the annual rent by his purchase and gift. Harvey's hall and library were furnished by him and equipped with books and with instruments at the time, and in his will he left "to the Colledge of Physicians all my bookes and papers and my best Persia long carpet and my blue sattin imbroevdred cushion, one paire of brasse Andirons with fire shovell and tongues of brasse for the ornament of the meeting rooms I have erected for that purpose."

But buildings and contents, and the statue of Harvey as well, were destroyed a few years later on the fourth day of the Great Fire. After that the new College buildings in Warwick Lane, built by Wren and Robert Hooke, were not opened till 1674. These buildings served the College for a hundred and fifty years, down to 1825, when the rooms in which we are met came to be identified with the College as they have now been for three generations. In more than four hundred years there have been but four buildings that have been the College of Physicians. If and when in the fifth century of the life of the College there is to be a fifth, the benefactions of Harvey and of Harvey for the second cannot be forgotten.

But it is not only benefactions such as these that we are bidden to commemorate. Our commemoration is to be of those who have built for all time who have sought and studied out "the secrets of Nature by way of experiment" and thereby made the College as they were members a house of fame and if not none the less have deserved well of it. Even in a legal document for the transfer of an estate this single-minded benefactor could not fail to make clear what in his opinion was the highest claim to *commemoration* as his whole life had shown—"the inquiry of truth" which" in the words of his contemporary, "is the lovemaking and the wooing of it."

"DE GENERATIONE ANIMALIUM"

Harvey, you remember, was 50 when he published the *De Motu Cordis et Sanguinis*, and had already been attached to the Court as physician extraordinary to the King for ten years. Four years later he became physician in ordinary to Charles I. Notwithstanding his duties at Court, and his practice both at St. Bartholomew's and among his private patients, and in spite of the political troubles of the times, he continued to make opportunities for pursuing his search into the secrets of nature, amassing materials for the remarkable work which he was at last persuaded to publish in 1651, when he was 73 years old—the *De Generatione Animalium*. "During a long series of years," he tells us there, "for three months in the autumn and winter almost every day I had the opportunity of dissecting numbers of hinds and does" in the royal parks and forests for the study of this subject—not only hunted animals, but also animals set apart for his special use. Week by week the changes are recorded from September on to the end of December. And though perhaps less systematically, he also carried out countless dissections of other viviparous animals during pregnancy. This was in the years before the war, the year 1633 he specially notes as an exceptionally early rutting season.

In 1642, after the battle of Edgehill, he was in Oxford, apparently till its fall in 1646. Of that time Aubrey says: "I remember he came several times to our College (Trinity) to George Bathurst, B.D., who had a hen to hatch eggs in his chamber, which they opened daily to see the way of generation." When Oxford fell, he gave up the wardenship of Merton, to which he had been appointed in the previous year, and returned to London or its neighbourhood. There we know he found that much of his most valued material, on the generation of insects, "the fruits of many years' toil, had not only with the permission but by *command of Parliament been abstracted by my enemies* from my museum" when his house at the same time was stripped of all its furniture. These notes that perished also must have been collected during the busiest years of his life before the war. He was now 63 and from this time he lived with his brothers either in London or in its neighbourhood, finding solace in my studies and a balm for my spirit in the memory of my observations of former years.

The *De Generatione* is therefore remarkable if only as witness to the single-minded constancy of a busy man "wooing and making love to truth" through half a lifetime. That it profoundly influenced the growth of knowledge, as did the *Opusculum Aureum* of 1628, cannot be maintained. That it is free from "that philosophy of discourse and disputation into which we are betrayed by the forces of our own minds" is too much to say. What work of those days was, if we except the *De Motu Cordis*? But it contains a mass of observation the result of sustained thought unwearying anatomical studies and, as has been so well put before us in recent years by Dr. Herbert Spencer, his watchful attention to a wide clinical experience. Naked-eye anatomy could do no more. It is easy to reflect that it was already possible for the anatomist not to confine himself to naked-eye observations. Harvey used a lens, but the compound microscope had been constructed a good many years before this book appeared. Had the distractions of the times been less cruel it would hardly have been left for Malpighi fifty years younger than Harvey, to reap the first harvest of *microscopic* anatomy in the years immediately following Harvey's death. Swammerdam indeed made the first observation of blood corpuscles within a year, and the histological publications of Malpighi began with the *De Lulio nili* a few years later. But the microscope has not even now solved the riddles of generation: we can indeed say pretty confidently that it will not. Such was the quest on which Harvey was concentrated for thirty years.

In the seventeenth century modern physiology was born, its birth was attended by two miracles. The first was the miracle of 1628, when Harvey bade medicine take up its

bed and walk, and the delusions of 1,400 years' enslavement to authority and tradition were swept away by the evidence of independent observation and experiment—one of the most remarkable chapters in the history of human thought The other was the miraculous birth of the physiology of respiration ten years after Harvey's death

There are passages in the *De Generatione* and the tract on parturition which suggest that Harvey was struggling to emancipate himself from the current doctrines of the functions of the lungs and blood "Whether the object of respiration is really to cool the animal shall be discussed elsewhere at greater length", and after giving good reasons for a different account he says

"If anyone will carefully attend to these circumstances and consider a little more closely the nature of air, he will allow, I think, that air is given neither for the cooling nor the nutrition of animals It is as if heat were rather enkindled within the foetus than repressed by the influence of air Thus much by the way on the subject of respiration, hereafter perhaps I may treat of it at greater length"

But there is no evidence that his own ideas of the nature of air would have furnished the answer to his questionings

The Birth of the Physiology of Respiration

He died in 1657 Robert Boyle, who had settled in Oxford three years earlier, was that very year at work with Robert Hooke upon his air-pump It was completed in 1659 He published his first account of the *New Experiments Physico-Mechanical Touching the Spring of the Air* a year later, and 1661, the date of the second edition, is the date of Boyle's law

In 1658, a few months after Harvey's death, John Mayow, in his eighteenth year, went as a commoner at Wadham to Oxford, where Boyle had been working for three or four years Two years later—in 1660—Mayow was elected a Fellow of All Souls, where he studied law and took his bachelor's degree in 1665, after five years He was, we are told, exempted from taking orders, because he was also studying physic In 1668 he published his first tract, *De Rachitide*, the following year his second, *De Respiratione*, and in the next year, 1670, he took his doctorate of law

Mayow's Contribution to Physiology and Chemistry

The *De Rachitide* is interesting first of all as in it we see how Mayow was saturated with the medicine of his day * It opens thus

'There has been only one so far as I know who has written anything on the subject of rickets, namely, the distinguished Dr Glisson, *and that may seem strange, because as a rule disease* as it stalks through the land cannot keep pace with the incurable vice of scribbling about it The disease made its appearance some forty years ago in the western parts of England, and since then has infested infants' cradles through nearly the whole of England, though more rarely the northern part of it"

Now that the causation of rickets is known, it would be an interesting subject for economic and historical research to trace, if this record is true, the cause of the appearance of this disease at that time, and in those parts He argues that the defective nutrition is not a defect of the blood Nutrition, according to the ideas of that day, was conveyed also by the nerves He shared this idea because, he says

"everyone knows when a nerve is cut not only is sensation lost but nutrition suffers Moreover when in an experiment on a dog I have accidentally wounded a nerve, on dissection after about three months I have found a fairly conspicuous glandular concretion where the nerve had been cut, and this seemed to have its origin from the nervous juice escaping from the wound of the nerve"

Upon the nature of the contribution of the nerves to nutrition he gives his views in other places Here he merely says that the nervous juice, meeting and mixing with the blood, produces a certain vigorous reaction and heat ("effervescentiam") The sections at the end on treatment contain many prescriptions, which for those not familiar with the details of seventeenth century therapeutics are a revelation The inclusion of 6 drachms of fresh butter in some of these is an accidental anticipation of modern practice, but it were better that we should not commemorate his advice that it should be administered in an extract *fimi equi non castrati recentis*

The tract on respiration of 1669 is much more important. The first question he deals with, the entry of air into the lungs, at once shows the school in which he had studied

"Some," he says, "attribute it to the abhorrence of a vacuum, or some fanciful attraction, others think that the air displaced by *the expanding chest pushes adjacent* air through the nose and mouth into the lungs, as if the air had an unalterable volume. Whereas if a fairly large bottle with a narrow neck be held to the mouth and the nostrils are closed, air is easily drawn into the lungs through the mouth from the bottle, though the surrounding air cannot be pushing it The entry of air is effected by its elastic property, so clearly demonstrated by Boyle, and by the pressure of its superjacent air on that which is nearer the surface of the earth When a bladder squeezed nearly empty of air is tied at the neck and put into a glass from which the air is then pumped out, it is seen to swell, however little air was left in it, as soon as the pressure of the air outside it is removed."

In the second edition of this tract, published five years later, he adds the well-known experiment, more aptly illustrating the entry of air into the lungs, in which the bladder is tied to the inner end of the pipe of a bellows, the valve hole of which has been closed with a glass window, as the blades of the bellows are separated, the bladder can be seen to swell with air, entering it through the pipe, and driven in by the pressure of the atmosphere

"The structure of the lungs is adapted for their inflation in this way, for they consist, as Malpighi has shown [eight years previously], of a system of most delicate membranes arranged so as to form an almost infinite number of orbicular vesicles communicating so that the air can pass from the trachea into them one after the other and inflate them as the lungs expand"

His description of the enlargement of the chest was in more than one respect for the first time correct, and particularly in that the double articulation of the ribs with the spine, which he was the first to describe in the second edition, 1674, owing to its obliquity when the ribs are raised, causes, not only the sagittal, but also the lateral diameter of the chest to be enlarged The importance and mode of action of the diaphragm, the significance of orthopnoea, and the small part played by muscular action in ordinary expiration are all clearly set forth

But it is in the account of the use of respiration that the important revolution appears The ideas that had been advanced before were three (1) that the entry of air cooled the blood, (2) that the expansion of the chest drove the blood through the lungs, (3) that the passage of air in and out of the lungs so mixed and agitated the blood that the separation of fluid from solid, known to take place when blood was left to stand at rest outside the body, was prevented

As to the first of these, he insists that air is necessary for activity and the generation of heat, not for cooling the blood This is a cardinal fact for him, and is fully developed later In the first instance, he may have owed this idea to Harvey, as we have seen

Secondly, the movements of the chest are not necessary for the pulmonary circulation to be carried out, though he recognizes that they help it blood injected into the pulmonary artery of a dead animal reaches the left ventricle without difficulty, and one has only to hold one's breath and feel one's pulse to recognize that plenty of blood circulates, although the lungs are not moving

And, finally, that the air does not merely mechanically agitate the blood and so ensure its being properly mixed, as Malpighi maintained in his letter to Borelli, *De Pulmonibus*, 1661, is clear, "since any air however often it had been breathed should be equally effective for this purpose, but air that has been breathed repeatedly cannot maintain life" He quotes, too, "the experiment recently shown at the Royal Society," in which a dog with its chest opened was kept alive by a stream of air driven from a bellows through the trachea, and escaping by punctures at the surface of the lungs He does not mention that it was shown by Hooke, perhaps because a similar experiment had been done by Vesalius But Hooke, and Mayow too, realized the importance of the

mistakenly say that medicine was not Mayow's profession, it was law that he practised in the summer at Bath

xperiment as showing that it was not necessary for the ungs to move in order that the animal should live provided fresh air was supplied If, with the lung distended o the same degree, the dog s nose and mouth were closed, t died

We may therefore state positively that something absolutely necessary to life is imparted to the blood by the air which is breathed and when this whatever it is is exhausted the air becomes useless and no longer fit for respiration Expiration has also this further use that in the expelled air certain vapours that exhal from the blood are at the same time blown out

This last however, is a point which he did not later attempt to develop

What it is in the air that is so necessary for life it is not easy to define It probably is certain very volatile nitrous particles abundant in the air which are communicated through the lungs to the blood This aerial nitre is so necessary for every form of life that even plants will not grow in soil deprived of it Even plants seem to have a kind of respiration and require air

What role this aerial nitre plays in animal life is our next inquiry It appears that when duly mixed with combustible components of the blood it brings about a certain reaction not in the heart alone but in every muscle that moves — in the heart because it is a muscle and therefore in its substance rather than in its cavities For it is necessary for every movement of the muscles, and without it there could be no movement of the heart the more violent the movements the more intense and more frequent the respiration because there is great expenditure of the explosive nitre made necessary by the chemical changes in the contraction of the muscle and also in the accelerated action of the heart which is made necessary by the richer flow of blood to the muscles

To this I add that it is proved by the experiments of the most illustrious Boyle that flies, bees and other insects after being cut through the middle can neither move nor live in a place void of air though in the air they move for some time These small animal therefore that have neither blood nor heart nor lungs at all events in their divided part must needs have air it would seem for no other purpose but movement alone

I have dealt in detail and quoted freely from this first treatise on respiration of 1669 because, while it is short and was written without the fuller development of experimental evidence that is found in the better known publication of 1674 the position is made clear the discovery of oxygen aerial nitre as a component of the air and its physiological importance, is clearly outlined A new planet swims into our ken

Influence of Boyle and Hooke

That Boyle had been an inspiration to Mayow is also clear But there had been other influences Robert Hooke went up to Christ Church from Westminster in 1653, in the year before that in which Boyle settled in Oxford he was five years older than Mayow eight years younger than Boyle Even at school he had been experimenting with flying machines He soon attracted the attention of the Warden of Wadham, Dr Wilkins who introduced him to Willis and so to Boyle Hooke, we know, was working with Boyle at the construction of his air-pump before Mayow went up to Oxford The *Micrographia* was published by Hooke in 1665 four years earlier than the first *De Respiratione* In this work 'the ingenious Mr Hooke as Mayow calls him had revealed himself in the first place as a born experimenter, a genius in a rather discursive one But he had also expressed ideas very similar to those used by Mayow, though in a totally different connexion He had examined with the microscope the structure of wood charcoal an object no less pleasant than instructive" and he proceeds to describe the dry distillation of wood and the part played by air in the process He speaks of air as a menstruum in which combustible materials dissolve with liberation of heat and, if the process is sufficiently energetic of high

> This dissolution of combustible bodies is made by a substance inherent and mixt with the air which is like if not the very same with that which is fixt in saltpeter which by multitudes of experiments that may be made with saltpeter will, I think most evidently be demonstrated Moreover to add the dissolving parts of the air are but few and therefore a small parcel of it is quickly glutted and will dissolve no more and therefore unless some fresh part of the menstruum be applied to the body to be dissolved the action ceases and the body lies to be dissolved and to shune which is the intention of it though placed in the greatest heat whereas altogether a menstruum when melted and red hot that abounds more with those dissolvent particles and therefore as a small quantity of it will dissolve a great combustible body so will the dissolution be very quick and violent Therefore as in other solutions if a copious and quick supply of fresh menstruum though but weak be poured on or applied to the dissoluble body it quickly consumes it So the menstruum of the air if by bellows or any other such contrivance it be copiously applied to the burning body is found to dissolve it as soon and as violently as the more strong menstruum of melted nitre

There is so much in this that is entirely new and so much that appears again *mutatis mutandis*, in Mayow experiments and arguments that it is clear there must have been intimate communion between the two Mayow indeed has been charged with plagiarism It would be as fair to make this charge and perhaps easier to maintain it against Hooke he published the ideas first and Mayow was then 25 and unknown when Mayow put them out, Hooke was well known and in middle life—not a good subject to play that game on And as a matter of fact similar ideas appear in Lower's *De Corde* (Chapter v) published in the same year as the first edition of Mayow's *De Respiratione* Lower speaks of the nitrous spirit of the air passing into the blood, and states as a dictum "wherever fire can burn with ease we can breathe with ease" a fact established by the experiments described by Mayow But here, too, there is no attribution to Hooke nor for that matter to Mayow But the fact that it was *Hooke who proposed* Mayow for the Royal Society in 1678 makes it likely that there was no plagiarism, but that Mayow, as a close student and admirer of Boyle, was also intimate with Hooke, and that they worked together and Lower, too, without stopping to define who had thought first of each experiment or each deduction That Mayow added nothing is certainly not the case To begin with he was a physician and Hooke was not, his first philosophical interest was biology Hooke was merely incidentally interested in biological science Gifted with exceptional mechanical ingenuity—when a boy at Westminster he is said to have invented thirty several ways of flying"—his contribution to science was in the contrivance of experiments of all kinds, as a microscopist he was interested in the structure of charcoal and in explaining why it is black more than in the structure of the living plant It is not my design to examine the use and mechanism of these parts of wood. that being more proper to another inquiry, which he leaves alone He graduates thermometers but not for physiological experiments It is in contributions to the technical perfection of the air pump, and his machine for cutting edges in clock wheels that he was at his best In the preface to his book he says he has "gleaned up here and there a handful of observations in the collection of which I made use of microscopes and some other glasses that improve the sense' just a discursive miscellany There, too he defines his own position in science

> It is the great prerogative of mankind above other creatures that we are not only able to behold the work of nature or barely to sustain our lives by them we have also the power of considering comparing altering a thing and improving them to various uses By the helps of art and experience some men excel others almost as much as they do beasts By the addition of such artificial instruments and methods there may be in some manner a reparation made for the mischiefs and imperfections mankind has drawn upon itself by negligence and intemperance and a wilful and superstitious deserting of the prescript and rules of nature

As a philosopher his work was typical of the best that the seventeenth century did for experimental science The remedy for the errors of human reason can only proceed from the substitution of

> the real the mechanical the experimental philosophy for the philosophy of discourse and disputation that chiefly aims at the subtilty of its deductions and conclusion without much regard to its first ground work All the fine dream and opinions which the luxury of subtil brains has devised would then quickly vanish and give place to solid histories experiments and works.
>
> The links upon which true philosophy depend are to begin

with the hands and eyes, to proceed on through the memory, to be continued by the reason, nor is it to stop there but to come about to the hands and eyes again and so by a continual passage round from one faculty to another it is to be maintained in life and strength as much as the body of a man is by the circulation of the blood through the several parts of the body, the arms, the feet, the lungs, the heart and the head"

He was indeed worthy of a place in the great quartet of Oxford students, who, in the decade following Harvey's death, were led by Boyle, but Boyle was first fiddle, Hooke second, and the subjacent biological ground-tones were supplied by Lower and Mayow

Mayow did not merely hang himself on If Boyle and Black and Cavendish are the great names contributed by this country to the creation of physical chemistry, Mayow's is great for the part he played at the birth of biological chemistry, a science to which chemistry owes as much as biology, and without which chemistry would have but three legs to stand on If the ideas in his work did not all originate with him (the evidence does not make it *clear that they did not*), by his own experiments he not only established them and made them his own, he extended their implication into fields of thought that meant much less to other members of the team with whom he worked

The ideas are there in this first edition of the *De Respiratione*, published in 1669, the year after Boyle moved to London Five years later in the "five tracts" they are extended, enlarged, and the experimental foundations for them given in a way which amply justifies the place that this estimate of his work assigns him

POSITION OF CHEMISTRY IN THE SEVENTEENTH CENTURY

It is difficult for us to-day—at first reading I, at any rate, found it impossible—to do justice to Mayow's *De Sal Nitro*, the most important of the five tracts that appeared in 1674, two of which are merely new versions of the earlier ones When he wrote, hardly any of the terms, hardly any of the ideas which are the alphabet of chemistry, had been defined The mists and vapours of the Middle Ages obscured everything It is universally recognized that in order to understand the greatness of what Harvey did, it is imperative to know what had been before, how in the history of human thought Greece and Rome had had to pass away, a new civilization to arise, and after seven centuries also pass away, and yet two centuries more go by before the light shone out that was lit by Harvey But in that field the Renaissance had then been at work for three generations, even if we disregard all anatomy before Vesalius

The Renaissance had done nothing for chemistry Van Helmont, almost exactly Harvey's contemporary, was the only forerunner in the seventeenth century, Paracelsus in the sixteenth, Basil Valentine in the fifteenth Van Helmont was hardly more clear of mediæval entanglements than Paracelsus It is true he weighed the growth of a tree and proved that the increase of weight did not come from the soil But he concluded that the tree must be made out of water, and argued that the gas into which it was converted when burnt was also transformed water The "incoercible" gas, "gas sylvestre," given off by fermenting grapes, was no less water In the six fermentations, which he is at pains to describe, by which food is assimilated to form the living body, there is hardly anything that we can recognize as conforming to fact, as there is nothing that rests upon accurate observation or experiment Paracelsus or the Arabs themselves could have done as well

There are but few sidelights on the position of chemistry at the time in England The sagacious Harvey, we are told did not care for chymistry and was wont to speak *against the chymists*" *In a well-known passage*, John Wallis Sedleian professor of geometry, describes the society of philosophers that met weekly in London, from at any rate 1645, out of which the Royal Society arose, and how

"about 1648 some of our company being removed to Oxford our company divided those in London continued their meetings there, those of us in Oxford did likewise and brought those studies into fashion there meeting first at Dr Petty's lodgings, *in an up the river's house because of the convenience of inspecting Lyes*"

But there were no chemists of the company Afterwards the meetings were held at Wadham at the lodgings of the warden, Dr Wilkins, later (some time after 1654) at those of the Honourable Robert Boyle In 1659, we are told by Anthony Wood, the antiquarian and gossiping historian of Oxford notables, Boyle brought from Strasbourg "the noted chemist and Rosicrucian, Peter Sthael," to lecture in Oxford, and settled him in the house next door to his own lodgings, so that the "elaboratory" which he had there might be convenient for Sthael's use Sthael apparently lectured for some years, for in 1663 Anthony Wood himself attended "The club consisted of ten at least", he mentions names, among them not Mayow's, but "John Lock of Ch Ch, afterwards a noted writer," also, you remember, a physician

"This John Lock was a man of a turbulent spirit, clamorous and never contented The club wrote and took notes from the mouth of their master who sat at the upper end of the table, but the said John Lock scorned to do it so that while every man else would be writing he would be prating and troublesome"

Boyle therefore—one of the inquiring minds who were putting into practice what Bacon had preached—was, unlike Harvey, interested in chemistry But after the first year of Sthael's course, which he presumably followed, he published, anonymously it is true—no doubt to spare the feelings of his protegé—a destructive criticism of the chemical philosophy of the day, *The Sceptical Chymist* It should have long been clear that the four elements of the peripatetics could not suffice when experimental chemistry began But the name of Aristotle kept them in swav, and experimental chemistry had been limited to the action of fire and the use of crucibles and retorts inherited from the alchemists The empirical chemists since Basil Valentine time, who appear to have been seldom great thinkers, had supposed that the properties of different forms of matter depended on the proportions in which the *Tria Prima* occurred in them—volatile mercury, combustible sulphur, and incombustible non-volatile salt Paracelsus dreamed of a whole system of medicine based on this sort of chemistry In the *De Origine Morborum ex Tribus Primis Substantiis* he says

"When you take a bit of wood into your hand your eyes tell you it is a bit of wood, a single substance, that is no use, a rustic can see that You will see deeper below the surface and know that what you hold in your hand is mercury, sulphur, and salt It is not till you recognize this that you can be said to see with the eyes of a true physician *He can see this* as clearly as the rustic his bit of wood, and what is true of the bit of wood is true of the human body Whatever burns is sulphur," and he instances resin, gum, turpentine, fat, butter, oil, and strong wine "Whatever smokes or can be sublimed is mercury, whatever is left as ash is salt"

Bacon commended and adopted this system of the chemists, and in 1622 published the outline sketch of a work he had planned, *Historia Sulphuris Mercurii et Salis*

Now that people were beginning to use their hands and eyes in the inquiry of truth and to think clearly, it was easy to see that this would not do But in *The Sceptical Chymist* there is little that is constructive

Mayow therefore found in chemistry no terms that had been defined, only such as meant one thing at one time and another at another

"Among the elements of the Peripatetics," he says in the fifth chapter of the *De Sal Nitro* "the two chief are fire and air For these two our *nitro-aerial mercury* [that is, oxygen] might justly be substituted, since it possesses a really fiery nature, and constitutes also the most active part of the air As to the 'spirit' of the chemists [that is, *mercury*], which usually heads their array of elements, what they mean by this *high-sounding term* I simply cannot understand, for the spirits of fermenting liquors which flare up when thrown on the fire should be included in another element of the chemists which they call *sulphur* [meaning combustible matter], while the corrosive spirits [spirit of salt, spirit of vitriol, spirit of nitre] *should* be dealt with among the salts from which they are obtained It the word *spirit is to* be retained, it is more appropriate for the nitro aerial particles in the air, at one time executing motions that are placid, at another the most violent imaginable

"In the census of the *elements sulphur* deserves the next place, because after our mercury it is the most fermentative It, too,

may at one time be sluggish and inert at another attain full vigour and maturity or even be untameably wild From the *conflict between these two [or a w should* as from the oxidation of organic substances] all the mutation in nature seem to arise

Then come the salts which include both the acid and the alkalis whether fixed or volatile of which salts in the modern sense are formed In actual use the term 'purely saline salt" means alkaline ash "acid salt" means the acid-component of a neutral salt Salt of tartar would be *potassium carbonate salt of wormwood the ash of* wormwood 'For the rest there is the ubiquitous water and no less ubiquitous Terra damnata" the lifeless earth, dead and damned that may be left to mineralise

That is at least a beginning a scheme that provides a setting for what to Mayow the biologist is the cardinal fact in chemistry, that not only the heart but the whole body lives and moves by the union of oxygen with *fuel carried* by the blood

The basal facts upon which he builds are two first, that in the air there is something which forms only a comparatively small part of it, but which has the same physical properties as the rest, and this it is which is necessary alike for burning and for supporting life the second that in nitre this same thing is present and for this reason combustible matter will burn if mixed with nitre even in the absence of air

De Sal Nitro

It is with the second of these themes that he deals first in the opening chapters of the most important of the five tracts, the *De Sal Nitro* Nitre can be formed in the soil only when air has access to it the air then contributes something But the soil certainly contributes something *too,*

> for nitre is formed in greater abundance in soil impregnated with fixed or volatile salt as in the neighbourhood of stables dovecotes or slaughter houses and also from oil containing quicklime or a lixivium

And he knows that when nitre is heated with tartar, the acid spirit of nitre escapes and much more alkaline ash is obtained than is obtained by heating tartar alone so that *nitre contains some fixed salt This fixed salt is also* obtained from nitre when it is heated with oil of vitriol so as to drive off the acid *spirit of nitre, the fixed salt being* left as the vitriolate, which has all the medicinal and other properties of vitriolate of tartar (potassium sulphate) And similarly, true nitre can be made by neutralizing *spirit of nitre* with salt of tartar (potassium carbonate) Therefore the fixed salt in nitre certainly is derived from the soil The other component of nitre, the acid spirit nitric acid does not itself exist in the air any more than nitre itself

> It is probable that the spirit of nitre is a compound and that some of its particles to which it owes its humid and grosser nature are derived from terrestrial matter others dry and extremely subtle agile ethereal and really igneous these at any rate are *certainly derived from air*

The cautious reserve with which this statement is made was justified a hundred years later when Cavendish showed that both kinds of particles existed in the air and could be made to unite *by the passage of electric* sparks through it

The part of nitric acid which according to Mayow's experiments is certainly derived from air is nothing else than oxygen,

> the igneo-aerial particles which are absolutely necessary for the production of flame let me therefore henceforth call the fiery particles which occur also in air nitro-aerial particle or nitro-aerial spirit

To account for the other component of nitric acid the evidence justifies him in concluding that it may be present in what we should call organic matter in the soil for which the chemists had provided him with no better term than "sulphur", and the formation of nitric acid from this leads him to a remarkable discussion of the part played by oxygen in the formation of acids generally instancing the conversion of iron sulphide by moist air into sulphate from which the acid spirit of vitriol can be obtained this is also the work of the nitro-aerial particles of the air 'much as in the formation of rust or in the souring of ale or wine" If he had only put it into Greek he would have *had the word "oxygen," and for the same reasons as those* for which Lavoisier gave it this name

A very important section also on a purely chemical subject, the mutual affinities of acids and bases, comes later in the treatise (Chapter xiv Of the heat of quicklime, incidentally of the combination of contrary salts") and is a clearer exposition of the subject than had yet been given

> Although acid salt and alkali pass into a neutral substance when they meet yet they do not as is generally supposed entirely destroy each other For example when the acid spirit of salt is coagulated with sal volatile (and the same is true of all alkali) although the mixed salts seem to be destroyed yet they may be *separated again with their forces* unimpaired This happens when sal armoniac or any volatile salt combined with an acid spirit is distilled with salt of tartar [potassium carbonate] For then the whole of *the acid in the sal armoniac will be coagulated* with the fixed salt of tartar but the volatile salt of which it also in part consists will escape of the same nature as before And the reason of this is that the acid spirit of salt is prone to enter into closer union with any fixed salt than it is *with a volatile salt so that it immediately leaves the volatile* salts to combine more intimately with the fixed salt If on the *other hand* oil of vitriol be united with salt of tartar they can scarcely be separated from one another not because they have mutually destroyed one another but because there *is nothing in nature with which either of them can unite more* firmly than they do with each other An acid salts leave volatile *salts to form a closer union with the fixed salt of tartar* with a more suitable spouse so no doubt fixed salts elect one acid in preference to another that they may combine with it in a *closer union*

The behaviour of nitre with oil of vitriol illustrates this

> The acid salt of nitre will pass under a mild heat into the receiving vessel whereas otherwise that spirit will not be carried up except by a very vehement fire And thus so simple because the acid salt of nitre is volatile and the *more fixed vitriolic acid* thrusts it from its consort the sal alkali so that it is released from its ties and carried up under the action of no more heat than is necessary for the rectification of spirit of nitre whereas otherwise it can hardly be divorced from fixed salts unless it be by the most *intense heat The mass left in the retort closely resembles* vitriolated tartar and can fitly be substituted for it

More follows, as on the combination of metals with acids on the sulphides of alkalis and metals and on the theory of incompatibles, that is equally lucid because it rests on orderly experiment done with understanding The application of the same ideas to the relation of quicklime to slaked lime and the carbonates fails but nothing better was done with this for eighty years The experiments are correctly carried out and observed but without Black's fixed air and the differentiation of mild and caustic alkalis the explanation goes astray

This work was published when Mayow was 34 he had taken his doctorate in law four years earlier he was practising medicine at Bath through the summer his real interest was the physiology of respiration he apparently did not consider himself ready to take his doctorate of medicine, but he found time to bring order into the chemical thought of the day in the intervals of his other occupations

The discovery of oxygen—by far the most important step yet taken in the history of chemistry—was of still greater interest in relation to the physiology of respiration The experimental development of this is in the seventh and eighth chapters of the *De Sal Nitro*

When a mouse is placed under a bell jar that rests upon a wet bladder stretched over the mouth of a larger vessel the animal as it breathes removes from the air under the jar the component of the air that is taken up in its lungs and the bladder bulges into the bell jar as the pressure is reduced in it so that the larger vessel may be lifted bodily by lifting the bell jar This is precisely similar to what happens when a flame has been burnt in a cupping

glass applied to the skin Similarly he describes in detail experiments in which he measures the amount of air consumed by a candle burning or by an animal breathing under a cupping glass immersed in water When the candle goes out and the levels have been duly adjusted the water is found to occupy one-thirtieth of the space previously occupied by air, when the mouse dies, one-fourteenth In neither case is it possible to kindle in the air that is left combustible matter by means of a burning-glass, as can readily be done in fresh air

These experiments could not have been done in Harvey's lifetime because the conditions under which alone they could be carried out had not been defined by Boyle Mayow carried them out with all precaution that could then be devised, and though they suffer from the defect that no account is taken of gaseous products of combustion or respiration, they open an entirely new chapter in the history of both chemistry and physiology The alembic and crucible no longer constitute the entire armament of the chemist, there is something better for him to do than to go on for ever distilling off mercury from blood and urine

"Clearly something in the air is absolutely necessary for life and enters the blood in respiration, for if the need for respiration were that the blood may be shaken up and divided into the minute particles by the movement of the lungs the animal should not die so soon, for the air that is left should be able to do this perfectly well, and as it is subject to nearly the whole pressure of the atmosphere there is no reason why it should not enter the expanded chest, for I have shown that it is the pressure of the atmosphere that causes it to do this It is true the bluntness of our senses prevents us from seeing the passages by which the air enters the blood [just as it prevented Harvey from seeing those by which the blood passed from artery to veins] They must be exceedingly short and minute, for they merely have to pass through the membranes of the lungs and they must be almost infinite in number And yet in lungs that have been boiled and dissected an almost infinite number of perforations like the minutest points can be seen with the microscope Whether they are the mouths of capillary trachea I cannot say

"Animals and fire draw particles from the air so that it loses elastic force, that these particles are of the same kind in each case is established If in a similar experiment to those previously described a lamp and a mouse are at the same time enclosed in a glass over water the lamp goes out first and the animal dies later But the animal dies in about half the time that it would have been able to live had the lamp not been there It is not suffocated by the smoke of the lamp, for the same result is obtained if spirit of wine is used, moreover I have tried to kindle with a burning glass, in a vessel in which an animal had died from exhaustion of the air, combustible material previously hung in it I had protected a part of the inside of the vessel from the condensed breath of the animal by a piece of paper which I could pull away by a string passing out below the mouth of the vessel But it would not take fire I shall not however make a final statement on this because the season being winter and the sky almost continuously covered with cloud I was not able to repeat the experiment

"When the lamp goes out or the animal dies the remaining space is filled with air diminished in volume but able to resist the pressure of the surrounding air I have indeed ascertained that such air is possessed of no less elastic force than any other air, for when the pressure of the atmosphere is removed it expands with no less vigour than common air"

Mayow published nothing after the five tracts Four years later he was elected to the Royal Society, on Hooke's nomination, left Oxford, and was married, and the following year died in an apothecary's shop off Covent Garden, and was buried in St Paul's Church there He was 39—the youngest of the Oxford quartette, and the first to die The five tracts were translated into Dutch five years later, into German one hundred and twenty years later, in 1799, into French in 1840, and into English in 1907

The only reference to his work for more than one hundred years after his death appears to have been made by Stephen Hales His work was forgotten His discoveries rediscovered were the starting point of modern chemistry By that time the men's minds had become ground in which the seed could germinate

You will, I hope, think that in our commemoration it is fitting that Mayow should be remembered in the twentieth century, if only because he was so sadly forgotten in the eighth

ANAESTHESIA FOR OPERATIONS UPON THE GRAVID UTERUS.*

BY

H W FEATHERSTONE, M D,

HONORARY ANAESTHETIST, GENERAL HOSPITAL, AND MATERNITY HOSPITAL, BIRMINGHAM

It is the intention of this paper to show how, by a wise selection of methods, the anaesthetist may collaborate with the obstetric surgeon to make his work more effective and the safety of the patient more secure

Preliminary Considerations—During pregnancy women tolerate anaesthetic drugs exceedingly well Last year, at the Birmingham Maternity Hospital, nitrous oxide was administered to more than three hundred women for dental extractions at all stages of pregnancy, and there was not a single miscarriage Ether, chloroform, gas-oxygen, and spinal anaesthetics are often administered for all kinds of surgical procedures, but, save in the presence of dangerous infections, such as peritonitis, it is rare for the pregnancy to be interfered with

Operations on the uterus and its appendages, when in the gravid state, fall into three groups (1) operations only on the uterus and its appendages, (2) operations on the uterine contents, and (3) operations on the gravid uterus together with its contents

Operations only on the Uterus and its Appendages

These operations are usually undertaken with the purpose of improving the course of the pregnancy, or of making normal and unobstructed labour possible, thus it may be necessary in the earlier months of pregnancy to replace a retroverted gravid uterus Inasmuch as muscular relaxation of the abdominal wall is required, and cyanosis is not advisable, ether preceded by atropine is more satisfactory than gas or gas-oxygen

Fibroid tumours (particularly those in the cervix) and simple ovarian cysts may obstruct the pelvic cavity, removal of these is often a matter of considerable operative difficulty The aims of the anaesthetist are therefore abdominal relaxation, the avoidance of circulatory congestion and oozing from cyanosis, and the least possible disturbance of the kidney and liver functions Perhaps the best compromise is obtained with chloroform, or a mixture of chloroform with ether Gas oxygen does not give sufficient relaxation, and the resulting tension and pressure on the uterus may produce an intrauterine haematoma, resulting in a miscarriage Spinal analgesia is useful because it controls the bleeding

Mr Lewis Graham of Birmingham has permitted me to quote a series of six operations for myomectomy which were performed under a mixture of chloroform and ether without any untoward event In one instance the fibroid was as large as a coco-nut and deeply embedded After removal, the base of the placenta could be seen at the bottom of the wound in the uterine wall, but the pregnancy continued normally By way of contrast, however, I may refer to a case, at the sixth month of gestation, in which an adherent degenerating fibroid was removed, under ether, with very great difficulty, the woman miscarried on the next day

Accidents to ovarian tumours, such as rotation or infection, may render the patient acutely ill, in these cases the anaesthetist must help the surgeon to save the patient's life regardless of the pregnancy Gas-oxygen is a very suitable agent, because anaesthetic toxaemia and post-operative collapse are reduced to the minimum Indeed, relaxation in these conditions is obtained with comparative ease Ruptured ectopic gestation is usually best dealt with under gas and oxygen But in a case of ruptured tubal gestation, which was complicated by severe bronchopneumonia, a spinal anaesthetic was employed with a satisfactory result

*A paper read in opening a discussion in the Section of Anaesthesia at the Annual Meeting of the British Medical Association, Winnipeg 1930

Operations on the Uterine Contents

Here although in the course of the operation the uterus may be incised or manipulated, the surgeon endeavours to effect his purpose on the contents of the uterus without producing any permanent injury or alteration in the condition of the uterus and the tubes. Taking this group on a wide scale we have to consider anaesthesia for (1) manipulation of the foetus to obtain good position and satisfactory presentation before labour, (2) normal labour and labour complicated by protraction, manipulation instrumental and so forth, (3) emptying of the uterus by direct operation including evacuation of the premature foetus or ovule and Cæsarean section for the viable foetus.

Manipulation of the Foetus in utero

A general anaesthetic is not usually required for the necessary manipulations are quite endurable and the expectant mother is not over-sensitive but in exceptional cases the malplacement may be intractable or the patient may be over anxious. Complete muscular relaxation under ether may help the difficult manipulation while if the psychological factor is the only difficulty, light gas-oxygen anaesthesia is valuable. Spinal analgesia will relax the abdominal wall completely but the uterus in such circumstances is firmly contracted, and thus it may not be possible to turn the foetus.

Labour

Early in the history of anaesthesia the pain of normal labour was treated by inhalations of ether and of chloroform. Sir J. Y. Simpson, in Edinburgh, was the first to demonstrate the anaesthetic properties of chloroform and his vigorous advocacy of its use in midwifery was soon supported by the consent of Queen Victoria to be herself chloroformed in childbirth—thus chloroform *a la reine*.

Mrs. Stanley Baldwin has recently led a campaign to provide "anaesthetics for British mothers," I think that medical opinion is agreed that the matter as raised by Mrs. Baldwin is debatable on several grounds.

Although millions of mothers have received chloroform a few points in its use may be worthy of mention. During the first stage chloroform is rarely needed. In the second stage amnesia should be aimed at. Analgesia and sometimes light anaesthesia are permissible but full anaesthesia stops the uterine peristalsis, and post-partum haemorrhage becomes a serious risk.

Many times it has been said that chloroform is safe for pregnant women, but that is not quite true. Light chloroform *a la reine* is indeed surprisingly safe, but I know two medical practitioners each of whom has lost a patient from heart failure during the application of forceps under full chloroform anaesthesia. Removal of the mask should precede application of the forceps. To allow the patient to administer chloroform to herself by squeezing the bellows of a Junker's inhaler is an accepted practice but it is necessary to be careful that the Junker's bottle is tested and fixed firmly out of harm's way, lest a pool of chloroform in the bed lead to severe burns.

Ether was used for midwifery before chloroform was discovered. It is pungent for the patient, it causes secretion bubbling and cyanosis when atropine has been withheld, and the stages of amnesia and analgesia are not maintained quite so readily as with chloroform. Nevertheless W. J. McCardie, after long experience maintains that ether may prove a most valuable stimulating anal gesic for a patient who is exhausted from a long labour. During recent years gas-oxygen has received much attention in connexion with midwifery. H. E. G. Boyle a pioneer in this respect, recommends that a gas-bag dispended with a four-to-one gas-oxygen mixture should be held in the patient's hand. Following instructions which have been given to her, she takes four or five deep breaths from the bag when she feels a pain coming and strains down. Thus partial loss of pain, good pressure from the abdominal wall and strong uterine contractions are secured. Dr. Boyle thinks that oxygen itself promotes contraction perhaps by eliminating sarco-lactic acid and thus preventing muscular fatigue. A little ether may be added when the head is passing over the perineum and the child is then born in a lively condition. The method is of undoubted value but the cumbersome nature of the apparatus tends to limit its employment to maternity hospitals and clinics. In the more protracted and serious complications of obstetric work such as high forceps manipulation, craniotomy and the like gas and oxygen has saved many lives.

The new anaesthetic drug avertin has been tried in this connexion and Dr. Doris Wall reports as follows:

Avertin is pleasant in its induction and has no action upon the foetus. There are no unpleasant after effects and there is the advantage of complete amnesia extending some hours after the delivery and long after the analgesic effect has passed off. The depth of anaesthesia produced is about that of twilight sleep, and when given in divided doses to a primipara it can be made to last throughout the second stage although this is sometimes difficult. Its duration appears to be increased by injecting the drug dissolved in milk.

The rate of the pains is slowed down to about half although their intensity is only slightly diminished. If any manipulation is required avertin must be supplemented with a little ether or with gas and oxygen.

I find that colonic-oil-ether has a similar effect but during induction it is not so pleasant for the patient it leads to more congestion and to deeper anaesthesia.

Spinal analgesia has been employed by many workers and Dr. Cosgrove in 1928 reported unequal results, the uterus was often flaccid and the perineum was relaxed probably due to a low injection—a caudal block. High intrathecal injection, with muscular paresis and analgesia up to the costal margin always produces relaxation of the trunk and lower limbs, including the abdominal wall and the perineum. At the same time, in my experience the uterus contracts tonically.

The effects of this contraction, I find, differ according to the stage of labour at the time of the injection. Injection of a spinal anaesthetic before the os is fully dilated leads to stopping of uterine propulsion, and the foetus does not progress until the anaesthetic effect has worn off. Injection after the os has dilated to the full extent may enable the accoucheur to compress the uterus sufficiently to expel the child with comparative ease or forceps may be applied or finally the foetus may not progress at all. Injection after the head has descended through the pelvic canal may lead to immediate delivery, especially if the child is small usually the child is readily expressed by gentle manual pressure on the abdomen.

It will be seen that the indications for spinal analgesia in normal labour are not impressive but in a small series of cases in the presence of severe heart disease I have found it useful. I inject the solution at the beginning of the second stage, when the os is fully dilated and the expulsive pains are strong. It is at this time that the diseased heart commences to run the gauntlet of overstrain. The immediate relief from straining down helps the patient to a remarkable extent. Forceps can usually be applied with comparative ease, and slow steady traction associated with pressure on the uterine fundus yields a satisfactory delivery. Birth of the placenta follows usually at once for the organ is exfoliated by the strong shrinkage of the uterine wall. Post-partum haemorrhage has not occurred in my experience, and indeed bleeding has been scanty. Epidural anaesthesia has received some attention but Dr. Rucker in 1928 reported that he found failure to produce analgesia to be not uncommon and that is a serious drawback.

We conclude therefore that in labour chloroform is the most generally useful anaesthetic while gas-oxygen is the most safe. Analgesia, by either the spinal or the local technique, has but a limited field. I may add that a woman told me recently that in 1918 when she was near term, an air raid frightened her so much that she was unconscious for two days during which time her baby was born.

Emptying of the Uterus by Direct Operation

Evacuation of an immature foetus, a mole or other retained products of gestation may require a simple dilatation and curetting or division of the cervix may be

advisable Dilatation under chloroform is attended with the risk of reflex cardiac syncope, gas-oxygen often fails to relax the legs sufficiently to allow of a satisfactory lithotomy position, and with all forms of general anaesthesia the risk of dangerous post-partum haemorrhage is very grave Considerable loss of blood is not uncommon, while fatal haemorrhage has occurred in the practice of many experienced gynaecologists

At the Birmingham General Hospital, Professor Beckwith Whitehouse, Mr Alfred Danby, and the anaesthetists have come to regard spinal analgesia as a valuable safeguard against this danger With analgesia up to the level of the umbilicus, we find that strong tonic contraction of the uterus is the invariable rule The loss of blood at the time of the operation is remarkably small, the post-operative loss is lessened, and the firmly contracted uterine wall offers satisfactory resistance, so that the curette or the ovum forceps can be employed without much fear of perforation of the uterus The presence of phthisis is often an indication for evacuation of the uterus, and because inhalational anaesthesia is undesirable, spinal analgesia has proved most helpful in a considerable series of these cases The toxaemias of pregnancy, diabetes mellitus, kidney disease, and heart disease are complications which are rendered less dangerous by the use of spinal analgesia for this operation

Anaesthesia for Caesarean Section

Inhalational anaesthesia is the usual method employed in Caesarean section, chloroform, ether, nitrous oxide-oxygen, ethylene-oxygen, and acetylene-oxygen have their advocates The aims of the anaesthetist are to avoid poisoning the mother with the drug, to prevent cyanosis, to keep the circulation brisk and the uterus free from congestive engorgement, and to allow the baby to be born in a lively condition, with the least possible amount of the anaesthetic drug in its circulation, so that it may cry and expand its lungs at once

It appears, therefore, that the gases nitrous oxide and ethylene are the more satisfactory anaesthetics because they are not toxic and because they are rapidly eliminated from the baby's blood stream

In any case we advise that morphine should be withheld before Caesarean section, and that the anaesthetic should not be commenced until everything is in readiness for the operation, that is to say, the skin should be prepared, the towels adjusted, and the surgeon have put on his gown and gloves The heavy abdominal contents may press on the heart and the bases of the lungs, so that additional oxygen may be necessary until the uterus has been emptied After the extraction of the child, anaesthesia may be deepened by the addition of a little ether Considerable experience with general anaesthesia for Caesarean section has shown that a smart haemorrhage from the incised uterine wall is the rule, and, not infrequently, it may be some minutes before the injection of pituitrin and ergot, together with the application of hot towels and massage of the flabby uterus, induces the organ to contract down and to arrest the bleeding

In December, 1922, Professor Beckwith Whitehouse and I employed spinal analgesia for Caesarean section in a woman, aged 29, who was suffering from diabetes mellitus We reported the case, together with a second, at a meeting of the Section of Obstetrics and Gynaecology of the Royal Society of Medicine in 1923, and we laid special emphasis on certain advantages which spinal analgesia presented Powerful and sustained tonic contraction of the uterine wall rendered the uterine incision almost bloodless, and the suture line was tight and accurate The child cried immediately after extraction, and the mother made excellent progress Since that time I have employed spinal analgesia for most cases of Caesarean section in which the patient and the surgeon were willing

The account of the technique and of the results, which I shall now give, is illustrated by the analysis of one hundred cases of which satisfactory records have been available The patients were treated at the Birmingham General Hospital and Maternity Hospital, and in private practice The majority of the cases were operated upon by Professor Whitehouse, to whose interest and initiative this work owes a great debt Sedative drugs, such as morphine, were not given until after the delivery of the child, in order that the child might be born free from respiratory depression

It might be thought that these women would be panic stricken at the idea of such an extensive procedure taking place while they were conscious But even the most apprehensive of women, once the injection has been accomplished, settle down quietly with the *will* to go through with the business In eighty replies to our inquiry as to their progress in hospital and subsequently there has not been a single complaint concerning the method One woman who had undergone Caesarean section on two occasions, the first under spinal and the second under general anaesthesia, called upon me the other day to express her gratitude and her preference for the spinal method In four instances patients in this series asked for spinal analgesia for a second Caesarean section, although one of them had suffered from a severe post anaesthetic headache on the first occasion

So much has been said and written on the different methods of producing spinal analgesia, such as light and heavy stovaine, spinocain, novocain, percaine, and tropacocaine, that I shall not dwell at length on the subject of technique In this series 1 c.cm of a 10 per cent solution of novocain was used on one occasion with success, but for the remaining ninety-nine the anaesthetic solution employed consisted of a 5 per cent solution of tropacocaine in normal saline This solution has a specific gravity of 1016, and it is therefore heavier than cerebro-spinal fluid, whose specific gravity is 1006

According to the size of the vertebral canal 1·75 to 2·25 c.cm of this solution is injected into the second lumbar space, while the patient lies on her left side We have formed the opinion that it is wise to prevent excessive loss of cerebro-spinal fluid In a test series some years ago headache occurred in nine out of thirteen patients where more than 5 c.cm of fluid escaped The patient is turned gently on to her back, her eyes and ears are covered, but her face is left free, lest she complain of feeling stuffy The table is tilted 25 degrees from the horizontal, with the head lowest Analgesia develops to the level of the costal margin, or even as far as the level of the nipples Failure to produce analgesia up to this level occurred only in two cases, due probably to an insufficient bulk of the solution

Special technique is but rarely necessary for the actual lumbar puncture In seven cases gas-oxygen was given throughout the operation, but, although the uterine contraction was satisfactory, the child was dazed for a few minutes after birth A single dose of ethyl chloride provides one minute's anaesthesia, during which the back muscles are relaxed, the lumbar injection is made, and apprehensive individuals, after regaining consciousness, soon settle down Dryness of the mouth is the source of much discomfort, but satisfaction is derived from the sucking of the end of a wet pad of gauze

As soon as the skin becomes anaesthetic, we notice that the uterus appears to bulge more prominently, and it becomes more hard to the touch When exposed, it is found to be firm and wrinkled with vertical ridges The direction of the ridges suggests overaction of the circular muscle fibres, and Whitehouse and I have adduced evidence experimentally to show that spinal analgesia produces strong contraction of the circular fibres of the uterine muscle This gripping effect of the uterus explains the failure of spinal analgesia, when given for miscarriage or labour, to expel the uterine contents

In about half the cases the pressure exerted by the firm erect uterus on the abdominal contents caused retching, but in nearly every instance the discomfort and the retching ceased as soon as the child had been extracted and the uterus had contracted down Notwithstanding the necessity in some individuals of opening into the uterine cavity through the placental site, when anterior, severe bleeding did not occur in a single instance Pituitrin and ergot were reserved for the relaxation of the uterus, which sometimes happened after the effect of the tropacocaine had passed off The ischaemic pallor of the uterine wall was always remarkable, indeed, in the majority of cases,

the total loss of blood during the entire operation did not exceed one tablespoonful Fifteen patients were in labour at the time of the operation and eighty five were not in labour the uterine contraction was equally successful in all of them

Provided that narcotic drugs have been withheld, the child kicks and cries immediately it is withdrawn from the uterus For a tired foetus at the end of a long obstructed labour, in many instances this freedom from drugging at Caesarean section spelt life instead of death The placenta is extruded by the strong contraction of the uterus, and the membranes rarely present any difficulty Suture of the uterine wound is performed neatly and firmly, for the edges are clean-cut and any tendency to relax subsequently actually increases the tension of the sutures

After completion of the operation, the patient is carried to bed very gently, and her legs are elevated higher than the head The lower half of the mattress is raised so that the legs are kept up, with the body horizontal and the head on a pillow This position is maintained for five or six hours and for twenty four hours every effort is made to keep the patient quiet A few hours after operation the uterine pains may be severe, and morphine is a great help At one time we employed scopolamine in addition but an anxious case of violent mania dissuaded us from the use of this drug Abdominal distension for two or three days occurred in 20 per cent but this is a frequent equel to any abdominal section During the periods of influenzal epidemics and in sufferers from bronchitis mild lung complications occurred but there were no fatal cases from pneumonia

By far the most unsatisfactory aspect of this procedure was "spinal headache," which occurred in 24 per cent of this series The headache started within twenty four hours of the operation it was suboccipital in location, and lasted either continuously or intermittently for one hour or for as long as a fortnight—in the majority of cases for twenty-four hours Undoubtedly headache occurs after plain diagnostic lumbar puncture, after spinocain novocain, stovaine, and percaine There is good evidence that the following precautions are valuable (1) use only solutions which have been freshly prepared (2) do not allow much cerebro-spinal fluid to escape (3) avoid puncturing the blood vessels on the anterior wall of the vertebral canal (4) do not inject air bubbles, and (5) handle the patient gently, do not move her more than is necessary, and keep her quiet for twenty four hours after operation

There were no permanent complications attributable to spinal anaesthesia the method was especially valuable in cases of phthisis heart disease kidney disease diabetes and goitre causing tracheal obstruction Only one patient died at or just after operation and she was actually expiring from heart failure before the operation commenced

I have gone into this method at some length for Professor Whitehouse and I believe that it is valuable if carefully carried out

Operations on the Gravid Uterus and its Contents

Hysterectomy of the gravid uterus in the later stages of pregnancy is a severe procedure Most frequently the operation is called for in the presence of concealed accidental haemorrhage, or for severe sepsis in the pelvic organs It is one of the most anxious operations of surgery The patient is toxic, suffering from shock and bloodless The more powerful anaesthetic agents chloroform and ether disturb the patient too much their use is followed by serious post-operative reaction, and pneumonia or failure of the heart or kidneys may follow

Spinal analgesia may produce a dangerous fall in blood pressure in a patient who is already nearly pulseless But one patient, aged 26, after Caesarean hysterectomy under 'spinal analgesia" in 1923 although she suffered from extremely severe post-operative pneumonia recovered and reported this year that she was in good health

Gas-oxygen is a most valuable aid Eight Caesarean hysterectomies were performed under gas and oxygen for concealed accidental haemorrhage, each patient was nearly in a dying condition when the operation was commenced One patient died half an hour after the operation was completed, one died on the sixteenth day but the remaining six recovered

In conclusion, therefore, I would summarize my views as follows

1 By a wise choice of method, the anaesthetist may be able to offer valuable help to the obstetrician and to the gynaecologist

2 In the more severe procedures, gas-oxygen is the best agent *for general anaesthesia*

3 Spinal analgesia has an important place in the technique of Caesarean section

I have to offer my thanks to Mr J T Howetson Professor Whitehouse Mr Lewis Graham Miss Hilda Shufflebotham Mr Alfred Daubs Mr Kenneth McMillan and Mr R P Graham for permission to refer to patients who have been under their care To Sister M H King of the General Hospital and to Sister Knight of the Maternity Hospital Birmingham I owe my grateful thanks for very ready help

THE DIAGNOSIS OF UNDULANT FEVER*

BY

C S WILSON M D, F R C P, D P H,

PROFESSOR OF BACTERIOLOGY AS APPLIED TO HYGIENE LONDON SCHOOL OF HYGIENE AND TROPICAL MEDICINE

It is becoming increasingly apparent that infection with organisms of the Brucella group, particularly with the bovine type of *Br abortus*, is by no means always followed by typical undulant fever Persistent malaise often accompanied by irregular fever, chronic ill-health, obstinate headache, joint pains, neurosis, certain skin rashes abortion in women, and focal infections of the internal genital organs in men, seem to be not uncommon manifestations of *abortus* infection Any attempt, therefore to ascertain the true frequency of disease caused by this *organism must take into account not only the clinically* recognizable cases of undulant fever but also those numerous cases of illness in which no definite diagnosis has been made

The methods available for the diagnosis of Brucella infections will be dealt with in turn

The Agglutination Test

This is best performed by mixing graded quantities of the patient's serum with a formolized heat-killed suspension of *Br abortus* incubating in a water bath at 55° C and reading the results after four and eighteen hours A strain of *abortus* should be selected that has been recently isolated many strains after continued subculture in the laboratory tend to lose their agglutinability Enough agglutinating suspension may be prepared at one time to last for several months There is no necessity in England at least to use more than one strain *Br melitensis* and the bovine and porcine types of *abortus* are agglutinated to a more or less equal degree by a serum prepared against any one of them, and the idea that it is possible to distinguish between these three types by direct agglutination is erroneous In Tunis however, according to Burnet' two distinct antigenic types of *melitensis* are met with necessitating the use of two suspensions in routine agglutination tests

The serum should be diluted from 1 in 10 to 1 in 5 120 if only one or two dilutions are put up a certain number of significant reactions will be missed

The interpretation of a positive agglutination reaction is often a matter of considerable difficulty and demands close co-operation between the clinician and the bacteriologist Many workers have emphasized the dangers of non specific agglutination It is noteworthy that this phenomenon has been met with chiefly in areas in which undulant fever is endemic Evidence has been accumulating to suggest that in such areas a certain proportion of the population is suffering from a latent Brucella infection and that the occurrence of agglutinins in the serum of these persons is really the result of infection and

* Paper read in the Section of Bacteriology Pathology Physiology and Biochemistry at the Annual Meeting of the British Medical Association Winnipeg 1929

not an expression of non-specific agglutination Indeed, with the exception of the bacillus of tularaemia, it is doubtful whether any other organisms are able to give rise to agglutinins for the Brucella group Comparatively little exact work has, however, been carried out on this question, and it is impossible to say more than that in the past the importance of non specific agglutination has been considerably overestimated Subject to this reservation the following general propositions are put forward

1 A titre of 1 in 80 or less, in the absence of clinical symptoms, is probably indicative of past infection with an organism of the Brucella group, not necessarily, however, attended by definite disease Exact evidence in support of this statement is not easy to bring forward, it rests partly upon analogy with other diseases, and partly upon the results of examination of Wassermann serums Hutchison and Wilson,[2] who examined 998 Wassermann serums in Manchester, found that 50, or 5 per cent, agglutinated *Br abortus* to a titre of between 1 in 10 and 1 in 80 On the other hand, only 4, or 0 4 per cent, reacted at a titre of 1 in 160 or over Such a high proportion of positive results in low dilutions, in a country whose milk supply is fairly frequently infected with *Br abortus*, seems to be most readily explicable on the assumption that there are always a considerable number of people who, during the past two or three years, have suffered from a mild infection with this organism

2 A titre of 1 in 100 or over, in the absence of clinical symptoms of disease, probably indicates a latent infection, or repeated past infections, not necessarily accompanied by definite disease It appears to be not uncommon for veterinary surgeons and probably others, who come into close contact with aborting animals, to give a positive reaction in a fairly high dilution Thus Huddleson and Johnson,[3] who examined the serums of forty-nine practising veterinary surgeons, found that no fewer than thirteen agglutinated *Br abortus* to a titre of between 1 in 100 and 1 in 500 Only three of the forty-nine gave a past history of undulant fever It may be added, in support of Proposition 1, that fifteen of the forty-nine reacted positively in a dilution of 1 in 50, indicating the existence of a past infection Similarly Thomsen (see Bang[4]) examined eight veterinary students just before leaving college, all reacted negatively to agglutination But of twenty-nine young veterinary surgeons who had been in practice for six to twelve months, twenty reacted positively, of these only three gave a definite history of undulant fever These observations indicate that only a minority of those infected with *Br abortus* develop clinical symptoms of disease, the remainder suffer from a latent infection, which can be detected only by laboratory tests

3 A titre of 1 in 100 or over, in the presence of pyrexia and other symptoms of disease, may be considered as practically diagnostic of active infection with an organism of the Brucella group This statement is founded on the wide experience of Kristensen and Holms in Denmark, and on that of workers in other parts of the world The demonstration of a rise, followed by a subsequent fall in titre during the course of the disease, strongly confirms the diagnosis

4 A titre of between 1 in 20 and 1 in 100, in the presence of clinically undulant fever, may likewise be considered as practically diagnostic of active infection It is abundantly clear that a patient may suffer from typical undulant fever, with a positive blood culture, without ever developing agglutinins up to a titre of 1 in 100

5 The complete absence of agglutinins from a patient's serum does not necessarily exclude the diagnosis of Brucella infection Such cases are uncommon, and appear to be more frequent in *melitensis* than in *abortus* infections (Burnet[5])

It will be realized that the agglutination test is of very real value, but that it is by no means infallible

Blood Culture

The patient's blood should be withdrawn during a pyrexial period, defibrinated, and distributed in 5 c cm quantities into at least two flasks containing 100 c cm or more of broth The exact medium used does not seem to be of great importance, but probably the most suitable is the liver infusion broth, originally described by Holth,[6] and later recommended by Stafseth[7] One of the flasks should be incubated aerobically, in case the infecting organism is *Br melitensis*, or the porcine type of *abortus*, the other should be incubated in an atmosphere of 80 per cent air and 10 per cent CO_2, in case the infecting organism is the bovine type of *abortus* (These remarks apply to England, in South Africa the bovine type of *abortus* appears to be capable, even in primary culture, of growing aerobically (Bevan[8])) Growth is often slow, and may not occur for two to four weeks, it is advisable to plate out on liver infusion agar every five days, incubating the plates both aerobically and in 10 per cent CO_2 The flasks should not be discarded until positive subcultures have been obtained, or until subcultures over a period of five weeks have proved sterile

The isolation of the infecting organism from the blood of the patient is clearly the most satisfactory way of establishing the diagnosis, and every effort should be made, by repeated blood cultures if necessary, to attain this end It must be admitted, however, that success is by no means uniform In undulant fever due to *Br melitensis*, it is generally possible, sooner or later, to recover the infecting organism, according to Nattan-Larrier,[9] blood cultures are positive in about 80 per cent of cases When, however, the disease is due to the bovine type of *abortus*, failure is often met with, and the percentage of positive results appears to be very much lower

Cultivation from Material other than Blood

According to Kennedy,[10] it would appear that about 75 per cent of cases with *melitensis* fever excrete the organism in the urine, the excretion is, however, in constant and repeated samples may have to be examined before a positive result is obtained Whether *Br abortus* is passed out by the urinary tract, it is at present impossible to say

Recently Amoss and Postoni have succeeded in cultivating *Br melitensis* and the porcine type of *abortus* from the stools of patients with undulant fever Their technique involved the preliminary concentration of the organisms by agglutinating serum, and then subsequent growth on eosin-methylene-blue plates

Sometimes pus from a focal abscess is available (Simpson and Fraser[11]) The organisms may be recovered by direct plating on liver infusion agar, preferably containing 1 in 10,000 gentian violet, as recommended by Huddleson, Hasley, and Torrey[12]

At autopsy cultures should be made from the spleen, liver, and mesenteric glands

Animal Inoculation

Cultivation of Brucella strains in liver infusion broth, or on liver infusion agar, with or without gentian violet, is so straightforward that little advantage is to be gained by the inoculation of guinea-pigs This method may, however, be employed for the examination of pus or other material contaminated with secondary organisms The animals should be injected subcutaneously into the thigh and killed three to six weeks later, cultures should then be made from the sublumbar glands and from the spleen It is interesting to note that there is a considerable discrepancy between the accounts in the literature of the lesions caused by the bovine type of *abortus* in guinea pigs In England the macroscopic lesions are extremely slight, and may be overlooked, generally, there is nothing more than a slight enlargement of the sublumbar glands and of the spleen, occasionally minute nodules may be seen on the surface of the spleen and liver by aid of a magnifying glass But in America it appears to be not uncommon for *Br abortus* to give rise to lesions that may be actually confused with those of tuberculosis (Schroeder and Cotton[13]) That this is not always the case, however, is evident from a recent paper by Hasley[12]

The Intradermal Reaction

This reaction, which was first described by Burnet,[14] consists in the intradermal inoculation into the anterior face of the upper arm of 0 05 or 0 1 c cm of a filtrate of a twenty-day-old broth culture of *Br melitensis* or

Br abortus A positive reaction is characterized by the appearance in six hours of a slightly raised oedematous plaque 4 to 6 cm in diameter distinguished in colour from that of the surrounding skin, the reaction, which may be accompanied by pain persists for about two days According to Burnet, the intradermal test is often positive when the agglutination reaction is negative, and he considers, therefore, that it is of greater diagnostic value than the agglutination test This may hold true in *melitensis* infections but it is doubtful in *abortus* infections, Huddleson and Johnson,[3] for example in a small series of cases, encountered one subject who failed to react to the intradermal test even though his serum had an agglutinin titre of 1 in 500 The test has the advantage of simplicity, and is well worthy of trial on a large scale

HYDRONEPHROSIS DUE TO KINKING OF THE UPPER END OF THE URETER

BY

R. P. ROWLANDS, M.S., F.R.C.S.,

SURGEON TO GUY'S HOSPITAL.

HYDRONEPHROSIS is usually due to obstruction of the flow of urine along the ureter The obstruction may be a stone or other body within the ureter, it may be a stricture or kink of the wall, or it may be something pressing upon the ureter from outside, such as an abnormal vessel,[1] fibrous band, or tumour

Here I am chiefly concerned with a valvular condition[2] of the upper end of the ureter which is often overlooked until the kidney has become seriously damaged or even destroyed by long-continued obstruction, with or without added septic infection I have had reluctantly to remove many such kidneys which could have been saved by timely operation

After nephrectomy there is always the fear that the remaining kidney may become fatally obstructed, for the anatomical abnormality is sometimes bilateral Hence the importance of drawing attention to this condition so that the obstructed kidney can be saved and not have to be removed

Etiology

There is very often a congenital narrowing at the upper end of the ureter where it joins the renal pelvis and sometimes there is a valvular fold of mucous membrane there, or the ureteral orifice is not at the lower end of the infundibulum of the pelvis, but on one or other side of the pelvis The ureter then runs for some distance along one wall of the pelvis, and is usually adherent to it Any distension of the pelvis in these circumstances is likely to obstruct the ureteral orifice in a valvular manner, this increases the distension and dilatation of the pelvis A similar state of obstruction is well known in the large arteries and in the oesophagus In the former a saccular aneurysm may obstruct the distal part of the artery in the latter a full oesophageal pouch frequently obstructs the distal part of the gullet

In the course of time, attacks of obstruction marked by renal pain become more frequent, the pelvis gradually dilates, and inflammatory adhesions take place around the pelvis, and these tend to increase the obstruction In one case of pyonephrosis I found the upper ureter folded into three complete kinks by such adhesions, the kidney was pyonephrotic, and so thin that it could not be saved Mobility of the affected kidney certainly adds to the obstruction, and great descent of the kidney may be an important cause of kinking of the ureter, but mobility is also a result of repeated distension of the kidney

Symptoms

There is a history of repeated attacks of pain in the loin behind and in front These attacks sometimes begin during childhood or adolescence, but more often during early adult life The pain rarely extends downwards to the groin or thigh, and there is rarely any dysuria or abnormal urine These points distinguish this condition from stone, but not from obstruction of the ureter by abnormal blood vessels Gradually the attacks become more severe and more frequent and before long a renal swelling may become noticeable during the attacks The appendix is frequently removed in mistake and without benefit, and I have known fruitless operations undertaken for supposed cholecystitis or for ileal kink In the course of time a typical hydronephrotic swelling may be found during the attacks, and pyonephrosis sometimes develops, with or without pathological urine

Diagnosis

Some of the pitfalls have been mentioned We have to distinguish this renal affection from those of the other abdominal viscera by exercising care and caution, and making complete examinations The location of pain and tenderness in front and behind the kidney is very important Cholecystography is often invaluable in excluding disease of the biliary tract We have then to distinguish this from other renal conditions, especially from other kinds of obstruction of the ureter, such as stone and abnormal renal blood vessels

The entire absence of blood, pus, or albumin is against stone, and so is a negative good radiogram, although this can never be quite conclusive Ureteral catheterization and pyelography, and possibly uroselectan, should generally establish the diagnosis long before the hydronephrosis becomes visible or palpable Finally, these repeated attacks call for operation, which serves completely to establish the refinements of diagnosis, and to cure the condition by simple operative measures

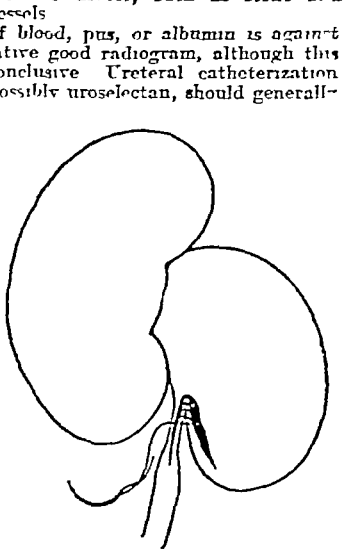

FIG 1.—Valve ureter operation The incision made to overcome the valve and stricture is shown. A continuous suture of fine catgut is inserted as demonstrated in the figure.

Operation

The kidney is explored through the usual time honoured and excellent oblique incision in the loin below the last rib The kidney is carefully separated and delivered, and turned forward so that the renal pelvis and ureter can be minutely examined from behind Any abnormal renal vessel or band of fibrous tissue obstructing the ureter is tied and divided If none of these or stone is found and yet the ureter is of normal size and the pelvis is dilated or distended, the diagnosis of valve ureter is established, and the condition is treated either by enlarging the opening, as shown in Fig 1 or after Fenger's method

[1] *The Operations of Surgery* vol. ii p 82.
The late Sir Henry Morris described this abnormality in his standard work *Surgical Diseases of the Kidney and Ureter* vol. ii p 423

(Fig 3), or by making an anastomosis between the lower pole of the pelvis and the ureter at the same level (Fig 2), fine catgut being used throughout

Division of the ureter, with implantation of it into the lowest part of the infundibulum is neither so easy nor so infallible as the methods recommended above

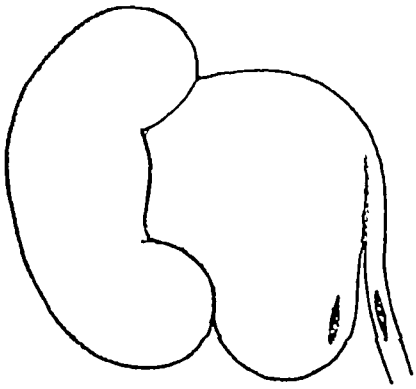

FIG 2—Large hydronephrosis due to valve ureter The opening of the ureter is high up The incisions for an anastomosis between the lower part of the pelvis and the ureter are shown

In the course of years I have operated on many cases of stricture, with or without valvulation of the upper end of the ureter, with excellent results, except in the late cases where the kidney has become spoilt and had to be removed in order to save life and relieve symptoms

The following examples illustrate the difficulties of diagnosis and the results of treatment some years after operation

CASE I—*Hydronephrosis due to Valve Ureter Mistaken for Cholecystitis, Ureteroplasty, Recovery*

A spinster, aged 39, had had attacks of pain twenty years previously in the right hypochondrium, alternating with attacks of appendicitis Appendicectomy was performed by Sir H T Butlin during an interval in 1903 After the operation the attacks of pain in the right hypochondrium often recurred, with sickness, they were thought to be due to floating kidney She felt very seedy with the attacks, and they recurred about once a week up to October, 1922 Between October and February she was free from them, but felt tired and unwell For the last five weeks she had had an attack about once a week She had no fever, and the urine was normal She saw various doctors in the country and in London, who thought the gall bladder was the cause of the trouble (? gall stones) Dr A H Spicer brought the patient to see me He had on several occasions felt a swelling in the gall bladder region, but the patient was not tender there when I saw her On repeated questioning she said she never had any trouble with micturition I agreed with the diagnosis of obstructive cholecystitis, and advised exploration An acute attack, with pain and swelling in the right flank, developed the night before the operation

Operation—March 22nd, 1923 Dr Spicer assisted A Kocher incision was made The gall bladder was normal, the liver low, and the duodenum normal There was a large hydronephrosis adherent to the under surface of the liver The abdomen was closed and an incision made behind in the loin The kidney was mobilized, it was rather thin The large hydronephrosis was partly emptied with difficulty by massage Valve ureter and stricture were found with adhesions to the pelvis Anastomosis, 1/2 inch in diameter, was made between the lower end of the infundibulum and the ureter Fine catgut was used The patient has remained well now for seven years

CASE II—*Hydronephrosis due to "Valve Ureter", Fenger's Operation and Nephrectomy Recovery*

A woman, aged 31 For twenty years she had sudden attacks of pain in the right groin, occurring at intervals of from a fortnight to six weeks, but having no relation to the periods For about ten years the patient had complained of attacks of pain in the right loin extending along the ureter In 1908 she was admitted into a medical ward for a swelling on the right side diagnosed as tuberculous kidney, but as the swelling suddenly disappeared, hydronephrosis due to a kinked ureter was suggested Radiography revealed no stone She was x rayed at Guy's Hospital six years later with a negative result, and I ordered her a belt, which enabled her to go on pretty well for about two years and then the pains returned in spite of the kidney belt Dr Stratton was fortunate to find her one day when the kidney was greatly enlarged He therefore sent her to me again with a view to operation The history of colic was very definite, and an x ray examination again failed to reveal any stone, therefore a diagnosis of either an abnormal artery kinking the ureter or valve ureter or a small stone was made

Operation—June 9th, 1916 I found a large hydronephrosis with a moderately good kidney, which seemed worth preserving The hydronephrosis was due to valvulation at the junction of the ureter and pelvis The ureter was quite natural, but the pelvis was larger than a cricket ball, and there was a very obvious kinking at the junction I therefore enlarged the opening at the *junction after Finney's method* of gastro duodenostomy, using fine catgut in two layers, the superficial one only taking up the fat There was no leakage of urine through the wound, and blood

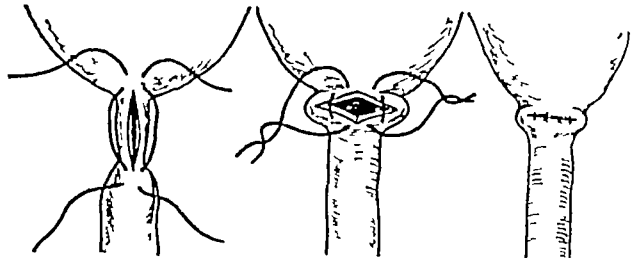

FIG 3—Pyeloureteroplasty, for stricture (Fenger's operation) (*a*) Stricture and valve incised longitudinally (*b*) and (*c*) Wound sewn up transversely

appeared in the urine next day A few days after the operation the patient had a feeling of distension in the old situation She made a good recovery, but had slight recurrences in 1921 and 1923

CASE III—*Hydronephrosis due to Valve Formation at the Junction of the Renal Pelvis and Ureter, Anastomosis, Recovery*

A married woman, aged 66, gave a history of severe attacks of pain in the left loin on and off for many years Sixteen years previously she was an in patient in the London Hospital for pain in the left flank, which was thought to be due to gastric ulcer There was no haematemesis A year later she was seen by the late Dr J H Bryant, who found both her kidneys unduly movable, and ordered an abdominal belt for their support About eight years ago she had haematuria for several months, and albuminuria for a year afterwards In the intervals between the attacks of colic she had an aching pain in the left flank In December, 1921, her doctor found a large cystic bilobular swelling in the abdomen close to the pubis on the left side, and he sent her to see me with a suggested diagnosis of growth of the colon

When I examined her (December 16th, 1921) the swelling was the size of a foetal head, very freely movable in the abdomen It could be pressed back into the left loin, but not into the right loin or right iliac fossa It was bilobular, the upper and left lobe being smaller and flatter than the spherical elastic lower and medial portion The left kidney could not be felt apart from this swelling A diagnosis of left hydronephrosis was confidently made The cause appeared uncertain, and might be due to small stone, an abnormal renal vessel pressing the ureter or kinking of the upper end of the ureter by the descent of a very movable kidney X ray examination revealed no stone, but a negative report in such a case is never conclusive for mate stones small enough to enter the ureter often do not show on the x ray plate While the patient was in Guy's Hospital undergoing investigations the swelling disappeared, and a very large amount of urine was passed

Operation—January 12th, 1922 The left kidney was exposed through the usual oblique incision in the left loin It was extraordinarily movable and low, its cortex was fair in consistency and colour, but thin, its pelvis was empty but greatly dilated the ureter normal and patent throughout The junction of the ureter and pelvis was thick and narrow, and placed far above the lower pole of the pelvis, thus forming a valve which became more and more obstructive as the pelvis distended with urine A long incision was made through the contiguous borders of the pelvis and ureter, dividing the valve The incision was then sewn in reverse with catgut, after Fenger's method, thus overcoming the obstruction The patient made a good recovery

CASE IV—*Hydronephrosis Destroying the Kidney "Valve Ureter" Nephrectomy*

A woman, aged 31, who was florid and fat, gave a history of three severe attacks of anaemia At the present time the blood is almost normal, red corpuscles being 5,000,000 and haemoglobin 80 per cent There was a very large swelling in the left loin the size of a man's head It was dull in front, movable from side to side and from above downwards It seemed to have an anterior hard edge like a spleen, *but the hand could be placed above it*, between it and the left costal margin, and I thought there was splenic dullness separate from it in the chest behind Mr Bellingham Smith had had her admitted to his ward about a year ago, but he thought the swelling had *nothing to do* with the pelvic viscera There were no urinary symptoms The diagnosis lay between splenic tumour, pancreatic cyst, and a very large renal swelling The woman was so fat that it was difficult to examine her well

Operation—April 10th 1924 A very long left paramedian incision was made, and it was at once found that the swelling was

retroperitoneal bulging forwards on the mesial aspect of the descending colon the transverse colon and the splenic flexure were above it. The great omentum was adherent across the front of it to the descending colon. The liver spleen, and other viscera were normal. A vertical incision was made through the peritoneum on the outer side of the descending colon and the tumour was shelled out and removed. It contained five pints of clear watery liquid and was the cystic remains of the kidney. There was no recognizable renal tissue in it but the ureter issued from its inner aspect at the lower point of dissection. The condition was one of valve ureter there was no constriction by any abnormal vessel. The ureter itself was small in size. Three large renal vessels had to be tied and divided. The other kidney was larger than usual but otherwise normal. The patient made a good recovery.

Case V.—*Hydronephrosis due to Valve Ureter. Ureteroplasty. Recovery.*

A very stout married woman aged 64 was admitted to Guy's Hospital on January 24th 1928. In 1906 *hysterectomy for fibroids* was performed. Since 1914 she had had numerous attacks of severe pain in the right flank below the costal margin passing through to the back below the last rib. For years these attacks were thought to be due to gall-stones. There was no history of jaundice or of anything wrong with the urine or urination. In October 1927, a bad attack developed with high fever and a swelling filling up nearly all the right flank which was evidently a hydronephrosis. The symptoms gradually abated and the patient was quite well until December 14th when the signs recurred with severe pain, vomiting and a large swelling reaching to the middle line with a temperature of 103° F. This time the urine contained large quantities of pus. With rest dieting and large doses of potassium citrate the patient got fairly well but the swelling did not entirely disappear, it could be felt in the right loin which was dull behind and resonant in front. X ray examination did not show any stone in the kidneys or ureters. Pus and only a little urine issued from the right ureter whereas the left kidney was excreting plenty of normal urine and the blood urea was normal.

Operation.—The right kidney was explored through the usual oblique incision in the loin. There was a large *hydronephrosis* containing offensive urine the kidney was considerably but not hopelessly damaged the ureter was normal but empty and completely obstructed at its origin high up on the inner wall of the greatly dilated pelvis it was not constricted by any abnormal renal blood vessel. The obstruction was overcome by slitting up the pelvis and ureter at their union the incision extending over an inch into each and being joined with fine catgut in such a manner as to remove the valvular obstruction after Finney's method of pyloroplasty. The patient made a good recovery.

THE SIGNIFICANCE OF REFLEX ACTION IN COLOUR VISION *

BY

FRANK ALLEN, M.A.,

PROFESSOR OF PHYSICS UNIVERSITY OF MANITOBA.

When the retina of the left eye has been stimulated by light of any pure spectral hue above a certain intensity it is found that the sensitivity of the right is enhanced for three colour sensations, which are invariably red, green, and violet. The predominant enhancement always occurs for the sensations complementary to the stimulating colour. If the intensity of the stimulus falls below a certain critical intensity, which for white light is about 0·25 metre-candle, the effect upon the right eye is opposite in character, since it *inhibits or depresses the sensitivity* of all three colour sensations. When the stimulating colour of sufficient intensity is applied to the right eye the measurements on that eye show that the one sensation, red, green, or violet, chiefly involved, if the stimulus is a simple colour, or the two if the colour is compound, as orange, yellow, and blue, are depressed in sensitivity, while the complementary sensations are enhanced.

These experiments, both contralateral and ipsilateral, may be readily explained by assuming the existence in the visual neural apparatus of a sensory reflex action which may exercise either a facilitating or an inhibiting influence on the retinal sensitivity by which its responsiveness becomes enhanced or depressed. As the basis of the visual theory I am presenting is the existence of such a sensory reflex, it is desirable to establish it with the greatest possible amount of experimental evidence.

In the sense of hearing measurements have now been made in my laboratory by J. F. Allen which show that stimulation of one ear by a pure tone either enhances or depresses the sensitivity of the other in a manner similar to the contralateral effects in vision.

In the sense of taste, also, measurements show that stimulation of one side of the tongue by solutions of sugar, salt acetic acid and sulphate of quinine, depress and enhance the four gustatory sensations, both ipsilaterally and contralaterally, precisely as in vision. It is found that weak solutions of these substances inhibit gustatory sensitivity, just as feeble light inhibits retinal sensitivity while in illustration of the facilitating process it is well known that distilled water stimulates the sweet taste after this has become enhanced in sensitivity by stimulation with an acid or a salt solution.

Besides eliciting the sensations of taste stimulation of the tongue by solutions evokes an enhanced activity of the parotid gland by which the amount of saliva secreted in a given time is much augmented. Inhibitory effects also occur. Measurements show that both ipsilateral and contralateral actions take place with appropriate stimulation.

In the muscles it has been found by measuring the angle of elevation of the arm by post-contraction after stimulation has ceased that stimulation of the left arm affects the right in the same way that stimulation of one eye or ear affects the other, or stimulation of one side of the tongue influences contralaterally the sensations of taste on the other side and the secretory activity of the opposite parotid gland.

No contralateral experiments in the sense of touch were thought of at the time the investigation was made. But it was shown that ipsilateral stimulation of the fingers of one hand enhanced the sensitivity of the index finger in the same manner that stimulation of one part of a retina influenced the sensitivity of an adjoining area or of one part of the tongue influenced adjacent receptors.

In all these cases it was found possible to express the measurements in a mathematical law which states that some measure of the response is proportional to the logarithm of the intensity of stimulation. The formula, which is similar to Fechner's celebrated psycho-physical law is $R = k \log I \times c$, where R is the measurement of the sensation, I the intensity of stimulation, and k and c are constants.

The evidence cited has been set forth at length in numerous papers published by the writer and his students. It proves quite conclusively the identity of the actions in all the neural systems to which reference has been made. No exception will probably be taken to the explanation of the phenomena of secretion and muscular contractions by reflex action. It seems reasonable to conclude, therefore, that the identical behaviour of the sensory neural apparatus similarly results from reflex action of a sensory character by which the sensitivity of the receptor-end-organs is controlled.

The theory of sensory action to which these investigations lead may be briefly stated as follows. When a suitable stimulus is applied to receptor organs the afferent nervous impulses excite characteristic sensations in the cortical centres, and in addition simultaneously evoke reflex impulses, which are conducted to the receptors causing either depression or enhancement of their sensitivity. The function of the sensory reflex actions is to control the sensitivity of the receptor end-organs. The alteration of sensitivity occurs in receptors for other sensation qualities within the area stimulated, and extends ipsilaterally to adjacent areas and contralaterally to corresponding areas on the other side of the body. Thus stimulation of an area of the right retina by red light, for example causes a sensation of red while the reflex or inductive reaction extends to the green and violet sensations within the area stimulated and to all three sensations in surrounding areas of the stimulated retina and to the corresponding area of the left retina as well. The inductive action of dim light of all hues is depressing in character, while that of bright colours is enhancing. After the retinal receptors,

* Read in the Section of Ophthalmology at the Annual Meeting of the British Medical Association, Winnipeg, 1930.

or, indeed, the receptors of any sense organ, have been stimulated, they recover their normal sensitivity by a series of oscillation of the reflex actions in which inhibition and facilitation periodically alternate with each other The retina is depressed or enhanced in sensitivity for further stimulation according to the time that has elapsed since the first stimulation ceased

This theory of sensory action affords a simple physiological explanation of many phenomena of colour vision, only a few of which may now be considered As remarked above, it has been found that when the retina is feebly stimulated with white or coloured light the three primary sensations are all depressed in sensitivity, so that their responsiveness is much lessened Vision therefore becomes doubly difficult in dim illumination, first, because the light is weak, and, secondly, because such light as there is lowers the retinal sensitivity This behaviour of the eye is probably a factor of great importance in such ocular conditions as miners' nystagmus On the other hand, if during some pathological condition of the retina it is desirable to secure visual relief for the eye, it will often be found advantageous for the patient to remain in a dimly lighted rather than a completely dark room A person suffering from detached retinas once wrote to me that the greatest relief experienced in years was obtained under such conditions

Experiments have revealed that the shortest wave-lengths of the spectrum, the extreme violet and blue, are as much as seven hundred times as powerful in exciting reflex action as the brightest yellow This leads to the conclusion that violet especially functions chiefly as a retinal sensitizer Artificial illuminants that are deficient in these rays are therefore devoid of an element most essential to visual efficiency Probably this inductive power is also possessed by the longer ultra-violet rays, so that a moderate amount of this light, under certain conditions, may be beneficial to vision Possibly the yellowish light of a miner's lamp suffers an additional disadvantage from the low intensity or absence of violet and ultra-violet radiation

Probably the most difficult problem in colour vision has been that of the explanation of simultaneous contrast It has been the rock on which most of the theories of colour vision have been wrecked The far-fetched theories of Helmholtz and Hering have admittedly failed to solve the problem The explanation of the reflex theory is simple, founded upon ample experimental evidence, and equally adequate for both uniocular and binocular contrast The general rule of contrast is that each contrasting colour appears modified, as if mixed with nearly the complementary of the other If, for example, contiguous green and yellow patches are viewed by one eye, the green light stimulates all three colour sensations—red, green, and violet—in the corresponding retinal area, but predominantly the green The inductive action of the yellow light enhances the sensitivity of all sensations in the green area, but predominantly the complementary violet sensation The green light consequently will stimulate this sensation more than normally, with the result that the green colour appears bluish-green In the yellow stimulated area the red and green sensations, whose equal excitation causes yellow, are stimulated more than the violet The inductive action of green light, however, enhances predominantly the complementary red and violet—that is, purple—sensations, of which red is visually the more conspicuous The yellow light will now stimulate the red sensation a little more than the green, and will consequently appear orange in hue Thus both colours appear as if mixed with the complementary of each other The same explanation applies to binocular contrast, for the reflex actions involved in the two cases are identical

There are two well-defined types of abnormal colour vision, which are known as colour-blindness and anomalous trichromatic vision Of the former, seven general classes are possible three classes in which one of the three fundamental sensations—red, green, or violet—is defective, three classes in which two of the sensations are defective, and one class, total colour-blindness, in which all three sensations are defective

According to the measurements of Abney, the white sensation is formed by equal stimulation of all three sensations In colour-blindness, therefore, no colour sensation can be entirely missing, since the colour blind see white, while totally colour-blind subjects see all colours as white or grey This indicates that in achromatic vision every colour always stimulates all the primary sensations equally Colour-blindness, or colour defectiveness, seems to be due to the excessive development of the inhibitory reflex actions which may affect any one, any two, or all three primary sensations The perceptual colour sensation pattern must consequently be modified to an extent depending on the degree and incidence of the inhibition

In anomalous vision the colour sensations are supersensitive The cases known seem to be limited to the red and green sensations The explanation seems to be found in the excessive development of the enhancing impulses According to this theory, both types of abnormal vision, particularly colour defectiveness, could be remedied if the efferent nerves could be stimulated at their cortical origin

In the bulk of humanity there seems to be preserved a proper balance between the direct results of sensory stimulation and the reflex actions which are evoked by them This condition is termed normal colour vision About 4 per cent of men have this balance disturbed by over development of inhibition They are accordingly selectively subsensitive in their defective colour sensations Another proportion, equally great, have the normal balance disturbed in the opposite direction by over-development of the enhancing actions Such persons therefore possess supersensitive colour sensations, or anomalous trichromatic vision

Probably a similar grouping of people can be made in regard to every sense organ The majority are normal, and smaller groups are either subsensitive or supersensitive Possibly this principle may be generalized to cover the intellectual powers and the emotional and volitional faculties as well For in all these divisions the normal, the supernormal, and the subnormal groups are well recognized Thus the principle at which we have arrived from experiments on vision may have in the broad field of psychology the widest application

The reflex theory strongly supports the trichromatic theory of Young The facilitating reflex actions by which the complementary sensations of the exciting colour are enhanced provide a physiological explanation of those phenomena for which Hering assumed a chemical assimilative process in the retina In these essential particulars, therefore, the two rival theories become harmonized

AN OUTBREAK OF FOOD POISONING IN STAFFORDSHIRE.

I—THE CLINICAL MANIFESTATIONS

BY

E S CLAYTON, M B, CH B, F R C S ED,

MEDICAL OFFICER, MANOR HOSPITAL, WALSALL,

AND

V E MILNE, M B, CH B, D P H,

MEDICAL OFFICER OF HEALTH, WALSALL RURAL DISTRICT COUNCIL

THE following cases are reported on account of three peculiarities

1 The rarity of the causal micro organism (the American hog cholera bacillus) in this country

2 The severity of the symptoms and the resulting high mortality

3 The limitation of the infection to one family

The disease was caused by the consumption of a pork pie, which was baked on April 9th and was purchased by the father of the family on April 13th So far as can be ascertained the pie was not exposed to any contamination between the times of manufacture and consumption It was consumed by seven children and their mother on April 13th, at 6 30 p m, the mother eating only a small portion The father and an older son did not

eat any of the pie. The mother vomited later in the evening but quickly recovered. Between 3 and 4 o'clock next morning the seven children became ill, suffering from abdominal pain, vomiting and diarrhœa; they were seen by Dr. Stewart of Walsall Wood, who advised their removal to hospital. The clinical details were as follows:

O. B., aged 4, was dead on admission.

I. B., aged 9. On admission the temperature was 104.4° F., the pulse 160, and the respiration rate 44. There were muttering delirium and restless movements of the limbs; the extremities were cyanosed and felt very cold. Glucose solution was run into the colon; camphor in oil was injected, and attempts were made to give brandy and glucose solution by the mouth. No further vomiting occurred after admission, but green stools containing a good deal of mucus and a little blood were constantly being passed. At 2 a.m. the general condition was unchanged, the temperature being 104.2°, the pulse 170 (!), and the respiration rate 44. The delirium prevented drink from being properly swallowed, and 20 oz. of saline solution were injected intravenously. No improvement ensued, and at 6 a.m. the temperature was 100.8°, the pulse rate uncertain, and the respiration rate 48. The patient died shortly afterwards.

S. B., aged 11. On admission the temperature was 103.2°, the pulse 170, and the respiration rate 30. There was muttering delirium with cold cyanosed extremities. No vomiting occurred after admission, and the stools which were passed about every half hour consisted of thick green-stained mucus with a little blood. Glucose solution was injected into the rectum, and intravenous saline and stimulants were given with no effect. At 2 a.m. the temperature was 104°, the pulse rate was uncertain, and the respiration rate 40. At 6 a.m. the temperature was 104.4°, the pulse unountable, and the respiration rate 64. Death occurred at 6.40 a.m.

L. B., aged 7 years, was conscious on admission. The extremities were cold and cyanosed. The temperature was 101°, the pulse rate doubtful, and the respiration rate 32. The same treatment was given, but in this case, as the child was conscious, she was able to drink well. Though the stools were frequent they contained very little fluid, being composed of thick green mucus with some blood. At 2 a.m. she was still conscious, though the pulse was quite absent, the temperature was 98.8°, the pulse doubtful, and the respiration rate 30. She vomited a little bile-stained froth at 2.30 a.m., but continued to drink well and to retain a good deal of her rectal glucose. By 10 a.m. her pulse could just be felt, and the temperature was 98°. No further vomiting occurred, and a stool was passed at interval of about an hour. The diarrhœa ceased in about twenty-four hours. No further rises of temperature occurred, and she made a slow recovery.

A. B., aged 5, was finished and ready on admission, but did not look very ill. The temperature was 100.4°, the pulse 122, and the respiration rate 26. The boy took drinks well and passed only one green stool during the night; he did not vomit. He was slightly feverish for twenty-four hours, and passed four or five green stools during that time. On the second day after admission he was well again.

M. B., aged 12½ years. The temperature was 99.2°, the pulse 104, and the respiration rate 28. She took drinks well and did not vomit. Her bowels were open twice during the night; the stools were relaxed but not green, and contained only a little mucus. She remained slightly feverish for thirty-six hours, but said that she felt quite well. Her stool was normal after twenty-four hours, and on the third day she was quite well.

N. B., aged 18 months (to whom a little pork pie had been given), had a temperature of 101.4°, a pulse rate of 152, the respiration rate being 28. The baby took drinks well and slept most of the night. She passed one relaxed (but not green) stool during the night, and one slightly green stool the next morning. She was a little feverish for twenty-four hours, but was quite well again on the second day.

The post-mortem examinations were conducted by Dr. Lamb, who reported the usual signs of a severe gastro-enteritis. A notable feature was the great enlargement of the lymphoid follicles. Specimens were examined bacteriologically at the Ministry of Health laboratory at Birmingham University and at the Staffordshire County Laboratory. *B. suipestifer* (American type) was isolated from the intestines of the fatal case and from the faeces of the living patients. The micro-organism was agglutinated in varying degrees by the serum of some of the living patients but showed agglutination up to 1 in 12,800 with its own specific serum. Further details concerning the bacillus are published in the following paper.

The father and other son who had not partaken of the pie were unaffected, and everything pointed to the pork pie as the source of infection. It is usual in these cases all the pie had been consumed, and none of it was available for bacteriological investigation.

The limitation of the trouble to the one family seems rather extraordinary, for the pie was made with 29 others on April 9th. 12 lb. of pie meat, being used for these 30 pies. The pie meat was delivered at the bakehouse about 11 a.m. on April 9th, in grease-proof paper in a tin, and it was transferred to a clean tin bowl. Pepper and salt were at once added, the pies were made, and put into the oven for about forty-five minutes, after which they were placed in a rack in the coolest part of the bakehouse. At 5 p.m. they were taken to the baker's home in a covered basket. Before leaving the bakery the baker jellied the pies with agar-agar. The jelly was made in an enamelled pot from which it was transferred to an enamelled jug and thence poured into the pies. The pig from which the pork for these pies was obtained was killed on April 7th. The leg of pork was boned and chopped on April 9th, about 25 lb. weight was chopped, and 12 lb. of this was sold and baked in the 30 pies. The other 13 lb. was used for making pies elsewhere, and no unfavourable reports have arisen regarding these.

The meat was chopped in a machine fitted with a motor and placed in an outbuilding. The drains have been tested and apart from a defective bell trap in the chopping-house no other defects have been found. The sanitary conditions of all the premises mentioned are quite satisfactory. In fact, although the pie was traced carefully from its origin to its consumption, it is quite impossible even to suspect at what stage it may have been infected. No other pie of the same batch has caused any unusual symptoms.

It is evidently customary to put the meat inside the pastry before cooking it. Infected meat may therefore be incompletely cooked, especially when a large number of pies are baked together in the same oven.

This is a brief report of a small outbreak of food poisoning due to a micro-organism which occurs very rarely in this country—namely, *B. suipestifer* (American type).

II.—THE BACTERIOLOGICAL INVESTIGATION

BY

JOHN MENTON, L.R.C.P. (EDIN.), D.P.H.,

BACTERIOLOGIST TO THE COUNTY OF STAFFORD.

Food poisoning due to the American hog cholera bacillus is rare in this country. The outbreak here described involved eight patients; there were three deaths. The bacteriological features were sufficiently interesting to stimulate a more detailed investigation than that which sufficed for routine identification.

Bacterial strains vary in their reactions, and even the same strain may show variation in different laboratories; such discrepancies are at times due to extraneous factor, but they can sometimes be explained by differences in the ages of the cultures, by the presence of variants, and by the occurrence of other changes in the bacteria themselves. The work was therefore continued for several months, and the results is now recorded not as a report of the outbreak, but rather as a supplement to the paper of Drs. Clayton and Milne. It has been decided to publish the various papers separately, so that those readers interested in one aspect will not be unduly burdened with the other.

The bacteria were isolated from the faeces of the living patients, and from a piece of intestine removed from one of the dead children. Plate cultures revealed two types of colonies after incubation for twenty-four hours at 37° C.: one was small, round, and glistening, the other was rough, more opaque, and showed crenated edges. After forty-eight hours' incubation the differences were accentuated. The rough opaque colonies were then four to ten times larger than the smooth ones, and the crenated edges had spread like streamers on the surrounding medium. The smooth colonies retained their uniform small size for weeks. The small colonies consisted of minute rapidly motile Gram-negative bacilli. The large irregular colonies contained pleomorphic Gram-negative non-motile bacilli. For convenience the motile bacillus may at once be termed Type H, and the non-motile bacillus Type O.

These types did not produce any change in lactose, saccharose, salicin, raffinose, dulcite, or inosite after several weeks' incubation at 37° C They both produced acid and gas within twenty-four hours in glucose, mannite, xylose, and maltose Type H caused slight acid and gas to appear in arabinose in twenty-four hours, these were profuse in forty-eight hours Trehalose underwent no change with Type H, but Type O induced rapid and profuse production of acid and gas These results were verified repeatedly The negative sugars remained unchanged for long periods Controls were also used

When first isolated the motile bacilli were very specific They were not agglutinated by the following serums typhoid, paratyphoid A, paratyphoid B, paratyphoid C (standard), Newport, Mutton, Gaertner, typhoid O, Stanley Reading, Derby, and English *suipestifer* (Plymouth) They were agglutinated with American *suipestifer* serum (Lister Institute) in a dilution of 1 in 12,500 in two hours The patients' serums gave rise to slight agglutination The non-motile bacilli were at first unagglutinable, but later showed granular agglutination with American *suipestifer* serum 1 in 800, and flocculer agglutination in the stronger dilutions The granular agglutination did not reach its maximum until after eighteen hours' incubation with the serum The H type gradually became less specific, and now agglutinates with these serums paratyphoid C (standard) 1 in 125, Stanley 1 in 2,500, Reading 1 in 500, Derby 1 in 125, English *suipestifer* (Plymouth) 1 in 2,500 Type O now shows agglutination with English *suipestifer* serum as well as with the American serum, but remains negative to the others Type O has a trace of H antigen, which is diminishing The serum of the last rabbit inoculated with this bacillus agglutinates it in a dilution of 1 in 2,500, but there is also some flocculation of the motile bacillus with this serum in a dilution of 1 in 50, which is weaker than in the previous experiments The presence of some H antigen in the O type is also shown by the American serum, which still causes flocculer agglutination with this type in a dilution of 1 in 50, in addition to the granular agglutination already mentioned

The inoculated rabbits' serums contained co-agglutinins for paratyphoid C (standard), English *suipestifer*, and in a few instances for Gaertner's bacillus, one of the patients' serums showed co-agglutinins for Gaertner's bacillus One rabbit agglutinated *B typhosus* 1 in 25, but absorption tests proved this reaction to be independent of the inoculations

The absorption tests showed

American suipestifer Serum		Lister Institute
Titre before Absorption	Titre after Absorption with Type H	Titre after Absorption with Type O
Type H 1 in 12 500 floc	Type H 1 in 250	Type H 1 in 12 500
Type O 1 in 800 gran	Type O negative	Type O negative

The motile bacillus absorbed a large proportion of the flagellar agglutinins from this serum, and the somatic antigen of this bacillus also removed the agglutinins for Type O Type O, being non-motile, could only remove the body agglutinins, leaving the flagellar agglutinins unreduced

Type O Rabbit Serum		
Titre before Absorption	Titre after Absorption with Type H	Titre after Absorption with Type O
Type O 1 in 2 500 gran	Type O 1 in 250	Type O negative
Type H 1 in 50 floc	Type H negative	Type H 1 in 50

When the flagellar antigen was removed from Type H by heating, it was also found that the somatic antigen of Type O showed slight absorptive preference for itself, but as this apparent preference may be due to various causes the subject is being further pursued

Both the types were innocuous to guinea-pigs on ingestion When injected subcutaneously the H type killed these animals, but the O type caused no evident ill effects Rabbits succumbed to alimentary administration of the H type, but the O type was harmless Filtrates of the motile bacillus were very fatal to rabbits, but had only slight effects on guinea-pigs

A small dose of washed motile bacilli was found which did not kill a guinea-pig when administered subcutaneously, but a similar dose of washed bacilli was lethal to another guinea-pig when the removed filtrate was again added to the micro-organisms No protection against living motile bacilli could be conferred on these animals by several inoculations of the filtrate

A short investigation was undertaken to gauge the value of complement fixation as a means of separating these types from each other and from the other closely allied members of this group Even with preliminary titration of the antigens this test was too lacking in specificity to be of any value for this purpose

Commentary

Here, then, is a food-poisoning micro-organism which shows two subtypes with morphological, cultural, biochemical, serological, and biological differences Some of these differences are more definitely fixed than others

The different reactions of the two types on trehalose are interesting, but as variations are well known in this group, especially with this substance, all that can be said is that for the time being the biochemical reactions of Type O are not identical with those of Type H It was formerly thought that the absence of fermentation in arabinose, inosite, dulcite, and trehalose separated the *suipestifer* from the paratyphoid B group, but Edwards and Rettger[1] have shown that this contention is not correct

The two types of antigen which produce flagellar and somatic agglutinins have been recognized for some time, Smith and Reagh[2] noted them twenty-six years ago The H antigen, associated with the flagella, is susceptible to heat The O antigen contained in the bodies of the bacteria is thermostable The types have been named according to the predominating antigen Their occurrence is not confined to the hog cholera bacillus Infection with O types of the typhoid-paratyphoid group may complicate bacteriological and serological diagnosis, and the ordinary two hours' incubation used for the macroscopic agglutination test may not reveal somatic agglutinins The reduced virulence of the O type may account for the mild symptoms of some of the patients, although it is difficult to understand how a patient could be affected with a single type when the two are associated

The existence of these variants encourages a belief in some degree of mutation, atavistic and involutional changes are always possible, and before any light can be thrown on this question a more stable classification of bacteria must be obtained At present it is difficult to draw the line between the artificial and the real distinctions that separate one so-called bacterial species from another

Conclusion

This paper describes some of the characteristics of a hog cholera bacillus which was responsible for an outbreak of food poisoning The outstanding features were the presence of two subtypes, and the high serological specificity of the cultures when the organisms were at first isolated

I desire to thank Dr *Schutze of the Lister Institute* for repeatedly supplying me with the American *suipestifer* serum My thanks are also due to Mr F W Duke, the chief laboratory assistant here, for his untiring assistance and patience during this investigation

MEDICAL, SURGICAL, OBSTETRICAL

TWO CASES OF INTESTINAL OBSTRUCTION

THE following two cases of intestinal obstruction are of interest owing to the similarity in the pathological condition and the very dissimilar effect produced by the same cause. The cases are also remarkable in view of the ages of the patients and the success which followed operative intervention.

CASE I

An unmarried woman aged 81 was seen by me on the morning of October 27th 1928. The history given was that for three days she had been vomiting with severe griping pain on the left side of the abdomen. The patient was collapsed the pulse rate being 160. The vomit had become faecal. Abdominal examination revealed an acute strangulated femoral hernia and a marked swelling on the left side of the abdomen showing dullness up to the level of the umbilicus. I persuaded the relatives to allow me to transfer the patient to a nursing home for operation. Under light oxygen and ether anæsthesia I relieved the strangulation and replaced the bowel without much difficulty. The patient made an uneventful recovery. Three weeks later I performed a laparotomy removing a large ovarian cyst at the same time. I repaired the femoral opening. The post-operative period was normal. The hernia was undoubtedly due to the pressure of the cyst. The patient is quite well now and able to perform her household duties. She has just returned from her seaside holiday.

CASE II

The second patient was a married woman aged 78 whom I was called to see on August 7th 1929. She gave a history of not having had her bowels opened for four days although enemas had been tried. She was vomiting and had intense pain and a sensation of fullness all over the abdomen. Her temperature was 100·2° F., the pulse 115. The abdomen was tympanitic and distended chiefly centrally over the right iliac region there was dullness. The patient informed me that for twenty years she had had a sense of fullness on the right side. I operated next morning and found that she had a right ovarian cyst held down in the pelvis by peritoneal bands. A loop of ileum had slipped in between two of these bands and become strangulated. The bowel was found to be quite viable when its strangulation had been reduced. I performed ovariotomy, the cyst was one of the largest I have ever removed. The patient made an uninterrupted recovery and has just returned from a holiday.

In the treatment of both cases I have been much indebted to the skilled assistance of my colleague Dr. C. M. Anderson.

Manchester.

PERFORATION OF DUODENAL ULCER WHEN FLYING

THE case recorded below is peculiar for the following reasons: (*a*) the symptoms of perforation came on suddenly when the patient was at rest; (*b*) this is perhaps the first recorded case of any similar abdominal emergency when flying.

At Reykjavik on June 30th a corporal in the Royal Air Force aged 30 developed acute abdominal pain when at an altitude of about 2,000 feet in H.M. Flying Boat *Iris*. The machine was immediately brought to the water and medical assistance sought from H.M.S. *Rodney* to which ship the patient was transferred without delay. He gave a history of dyspepsia extending over several years, and his clinical condition was typical of perforation of an abdominal viscus. The immediate operation performed was suture of a perforation of the duodenum, and it presented no peculiarity worthy of note. Convalescence was uneventful.

F. TWIGG,
Surgeon Commander, R.N.

H.M.S. *Rodney*.

Reports of Societies.

TREATMENT OF CHRONIC INFECTIONS

AT a meeting of the Section of Therapeutics of the Royal Society of Medicine, on October 14th, Dr. PHILIP HAMILL took the chair and delivered his presidential address on the treatment of chronic infections. He said that it was now realized that low-grade infections with or without exacerbations were responsible for much ill health. It was difficult to diagnose the nature of these infections, since many organisms might be recovered from a lesion, and it was not easy to say which if any were to blame and which were secondary infecting agents. The aim of treatment was to render the site unsuitable for the growth of organisms, to remove toxins to attempt to apply preparations toxic to the organism but not to the body, and to raise the resistance of the patient.

As far as protozoal infections were concerned a high degree of therapeutic success had been obtained by the use of arsenic, antimony, bismuth, and benzidine derivatives. He would be interested to know how much he malaria treatment of general paralysis of the insane depended on the rise of temperature produced. Recently good results had been reported from a rise of temperature induced by diathermy; if these were substantiated this form of treatment was likely to prove highly valuable. An analogous use of diathermy was found in the treatment of gonococcal cervicitis, where it was possible to cause a local rise of temperature above the thermal death point of the organism without injury to the tissues of the patient. In the bacterial infections chemotherapy was of less value where the organisms were on the surface or in cavities communicating with the surface. Powerful antiseptics were apt to damage the tissues, and in any case it was difficult to secure the prolonged and intimate contact between the drug and the organism which was essential for success. In addition, many antiseptics were inactivated by serum or discharges, flavine was an exception, but for some reason its use had decreased of late years. The chief objection seemed to be the staining of the tissues, which made it unpopular with patients, but cosmetic disadvantages should not be allowed to outweigh therapeutic advantages. In some situations the question of time could be solved by the application of ointments and plasters, and in other sites tampons could be used.

Dr. HAMILL explained that he would pass over infections of the eye and mouth because they had received so much attention in the past, in the nose and ear the difficulties of treatment were partly mechanical. It was not easy to obtain free drainage, and although the mastoid antrum could be obliterated this was not always possible with other cavities. Some surgeons advocated packing the nasal sinuses with silver protein preparations for an hour or more, but though good results were claimed by some others condemned the method as useless; probably the truth lay somewhere between these two extremes of opinion. Ionization with zinc was used fairly extensively in children's clinics but the technique was difficult to apply in the nose, although this method was becoming more extensively used there was no indication that it was being adopted as rapidly as would be the case if it were an infallible remedy. It would be interesting to know whether the action was thought to be on the organism, or whether the results depended on a stimulation of the epithelium. Ultra-violet light treatment had also been recommended for the nose and radium had been used as an epithelial stimulant. Chloramine was used by a few, and he would like to know whether there were objections to its use. In the lung much had been done to cure chronic infection by the use of surgical measures; collapse of the lung by pneumothorax or by phrenicotomy had been of great value in bronchiectasis. Essential oils, notably creosote had a marked effect in diminishing sputum though it was difficult to understand the mechanism by which it acted considering how small the amount of oil must be which was excreted by the bronchial mucosa. Infection of the biliary tract could be much improved by repeated doses of magnesium sulphate to induce drainage; discomfort was rapidly relieved by

this treatment, and cases were recorded of known typhoid carriers who had been rendered innocuous by this method alone Good results were reported following massive doses of hexamine, though it was difficult to see why this should be the case, since the bile was an alkaline medium In chronic colitis irrigation by innumerable substances, including silver nitrate and silver protein salts, had been attempted, but the results were not impressive In some cases good results had been obtained with injections of antidysenteric serum, and occasionally a case of ulcerative colitis would clear up rapidly after a blood transfusion Cases of amœbic dysentery were occasionally missed, but recovered when emetine treatment was begun Treatment of urethral infections was difficult because the organisms were in the crypts of the glands, massage was usually recommended to empty the glands, and good results were claimed from the injection of silver protemate into the urethra, other observers, however, denied the value of this method The use of diathermy for *gonococcal cervicitis* had already been mentioned, but unfortunately this treatment could not be employed for infections in the male Ultra-violet light from a titanium arc had been used, and it was claimed that the rays were sufficiently penetrating to destroy organisms through a considerable thickness of tissue, they might act, however by provoking a tissue reaction Intrauterine infections were difficult to treat by the direct application of any preparation, but drugs could be given to increase secretion, and infected endometrium could be removed by curettage

Drugs given by the mouth or by injection did not appear to be extremely valuable in chronic infections, some experts spoke well of *mercurochrome* and others found it unsatisfactory Creosote was an exception among drugs given by the mouth, and urinary antiseptics were valuable in some cases The stimulation of the tissues appeared to be a hopeful line of treatment, and ultra-violet light had been found to be of value in cases of varicose ulcer Modern methods of treatment of varicose veins should diminish the incidence of ulceration in the future Ergosterol ointment had been recommended for this condition, and it would be instructive to know what results had been obtained General methods included adequate nutrition and good medical care, vaccines had been *periodically blessed and damned with faint praise*, but they were certainly useful in some fields, patients with chronic bronchitis were often more comfortable after therapeutic inoculation, and elderly persons with chronic cystitis often benefited considerably from vaccines, though complete cure was rare there was generally a marked reduction in frequency of micturition, which was much appreciated by the patient Chronic colitis was maintained in many patients by a streptococcal infection, an improvement, sometimes rapid, followed the use of a vaccine in these cases Opinions were divided on the value of vaccines in genito-urinary infections Protein shock therapy had been popular a few years ago, but was now less commonly used, blood transfusion often had a remarkable effect in clearing up residual infections, especially in chronic colitis, where an infection of three or four years' standing might clear up in two or three weeks following a transfusion

In conclusion, Dr Hamill asked the opinion of the meeting on several points What antiseptics were of most value locally? What was the value of methods said to augment nutrition and general resistance, such as ultra-violet light and the use of ergosterol? What was the general opinion of the importance of vaccines, protein shock, and blood transfusion as therapeutic measures to combat chronic infection?

Dr W LANGDON BROWN said that recognition of the importance of focal sepsis was the discovery of the twentieth century, the usual routes by which chronic infection entered the body were the alimentary canal and the genito-urinary system Where it was possible to eliminate the focus, treatment was a success, otherwise it inevitably failed There must be a fallacy either of observation or technique when a drug was praised by one man and condemned by another Sir Thomas Horder had said not long ago that after twenty-five years of hard work he found that all he could do for a patient with ulcerative endocarditis was to treat him on the lines of the tuberculous patient—that was, to give him *rest and open-air treatment* and to attend to his nutrition, in other words, to improve his resistance as much as possible Many of the measures advocated for the treatment of chronic *infections depended* for their value on an improvement in the resistance of the patient, salvarsan acted more on the tissues of the patient than on the spirochæte, transfusion of blood was only another way of increasing resistance To turn to the question of ulcerative colitis, more than 50 per cent of patients with this condition had achlorhydria, and it might be said that the infection arose more from a weakness of defence than from the strength of the attack Many patients recovered if given hydrochloric acid regularly, it was a second discovery of the twentieth century that persons were disposed to suffer as a result of achlorhydria, a condition affecting 4 to 6 per cent of the total population Dr Langdon Brown agreed that hexamine *could improve chronic infections* of the gall bladder, though it was difficult to understand its *mode of action*, he quoted several cases in which hexamine had been given while the gall-bladder was being drained, and in which a colourless flow of bile, indicating reduction, had followed two hours after administration of the medicine, in a control case where alkalis alone were given, reduction had not taken place

RADIOLOGY ITS PROGRESS AND FUTURE

IN the Section of Electro-Therapeutics of the Royal Society of Medicine on October 17th, Professor J M WOODBURN MORRISON delivered the annual address from the chair

In a brief review of the progress of radiology and a forecast of its future, Professor Woodburn Morrison said that few branches of medicine had made greater progress during the last thirty years, and the debt to the pioneers who blazed the trail should not be forgotten In the matter of apparatus the radiologist was now furnished with machines of such power that only experts should use them Transformers working at 600 and 900 kilovolts had been made, together with tubes to stand up to them Two things he would still ask of the manufacturers first, that all apparatus should be shock-proof, and yet be *capable* of giving sufficient output for rapid work, secondly, that all x-ray films should be non-inflammable Possibly an entirely new substance to replace celluloid would have to be produced for use as a base, but in view of the other wonders of modern chemistry this was surely possible No one appreciated the efforts of the manufacturers and designers of modern electrotherapeutic and x ray apparatus more than himself The instruments were of such precision that almost any intelligent person could be taught to use them or supervise them in a few weeks Progress in treatment of many conditions by electrotherapeutic methods had been steady, and in the treatment of inflammatory conditions of the lungs by diathermy there had been definite advance The method was only in its infancy, and opened up a wide field to the research worker Treatment by ultra-violet radiation had passed through its boom period, and, although still suffering from the exaggerated claims made for it, it was now finding its place as a useful addition to established treatment in many cases With regard to a suggestion that physiotherapy should be added to the Section, Professor Morrison said that modern medicine was sometimes declared to be intolerant of innovations, this was only when the innovators set up absurd claims to be possessors of the whole truth, and, repudiating all authority, held out to those who trusted them extravagant and unwarranted expectations The practice of medicine could not be separated into watertight compartments One could never speak truly of any *method of practice* as being the only one Medicine was sufficiently catholic in its outlook to include its many and varied branches, and only those were excluded who by their own conduct shut themselves out With these reservations, it might be that there was no objection to the inclusion of physiotherapy in the Section There was no need to put forward extravagant claims for x rays in diagnosis The use of x rays was now

universal and it was even necessary sometimes to speak of its limitations The medical student was apt to rely too much on x ray examination, forgetting that it was only a part of an examination by physical means The term "x ray diagnosis" was objectionable Progress had been made in x ray treatment, which could now be carried out with safety to both operator and patient The blatant and exaggerated claims made on the introduction of the so-called 'deep therapy" into this country did a great deal of harm to radiology, inasmuch as they destroyed the confidence of the public but the public were soon enlightened and an enlightened public opinion was a very healthy corrective Good resulted, however, in the shape of improved apparatus and the method had now found its true place in the treatment not only of malignant disease but of many other conditions In malignant disease he thought that the existence of an x ray therapy department of a hospital could be justified by its failures If only the diseases as named were considered, the treatment must be set down a failure but it was different when the whole case was reviewed Inoperable and advanced cases of malignant disease were guided and cared for through a long and trying period and life was made easier and brighter for the patient and his friends The result might be called a failure but viewed in another light it was an outstanding success

Turning to radium therapy Professor Morison complained of much loose thinking and writing on the subject He appreciated the pioneer work of the radium institutes and research organizations, but he deprecated some recent books on the subject of radium and cancer which gave the impression that radium was a cancer cure A statement which was also made without sufficient basis was that cancer was increasing It was, of course, a true statement, in that the number of deaths from cancer was greater than formerly, but according to Dr Dunlop, Registrar-General for Scotland, when dealing with the recorded deaths from cancer in that country from 1911 to 1928, the fact that more people now lived until the age when cancer incidence became high accounted for three-fourths of the observed increase in the cancer death rate, and the remaining increase (except in mammary cancer) could be attributed to better recognition of the disease principally by histological and x ray examination Professor Morison thought that it was time to consider the question of making cancer a notifiable disease, so that more exact information might be forthcoming The Radium Commission certainly did not regard the question of cancer as one which was settled, and that all it had to do was to dole out radium to approved institutions, it was of opinion that careful inquiry and research were called for under the guidance of leaders of the medical profession At the present moment radium centres were springing up all over the country, and young medical men who had forgotten most of the physics they learnt during their first year in medicine, who had had no training in radiology and no sufficient experience in the surgical treatment of cancer to be in a position to give a considered opinion on the relative merits of the methods, were sent abroad to various clinics, and on returning were appointed radium officers to hospitals After reading an interesting letter by Dr Graham Bell, the inventor of the telephone, published in 1903, suggesting the introduction of radium tubes into the tissues, Professor Morison said that the trend of radium therapy in the great Continental centres was to avoid the direct introduction into the tissues of needles and tubes wherever possible, the line of advance being the development of the surface applicator One bright spot in radium treatment of cancer was in cancer of the cervix but it had to be admitted that radium therapy, so far as concerned cancer in general was still in the experimental stage All the time, in both radium and x-ray therapy, there was a call for more powerful weapons, but those weapons were dangerous and difficult to control The practice of radium therapy still required the co-operation of the surgeon, the physicist and the radiologist Radium therapy had not yet 'replaced the use of the knife in the treatment of cancer,' it might never do so, but it was a useful auxiliary capable of alleviating distressing symptoms and of prolonging life The whole subject was one for carefully directed inquiry and research, controlled by the faculties of medicine of the great universities

Speaking of the teaching of radiology Professor Morison referred to the granting of a diploma by three universities At the present day, when the medical curriculum was so overcrowded that there was hardly time given for the undergraduate to think of anything but examinations it was difficult to see how radiology could be satisfactorily included, but, as he had found in his own experience, a course in radiology was arranged students would attend voluntarily Finally Professor Morison touched on the status of the radiologist He looked forward to the day and thought it was coming soon, when every radiologist who had cases to treat would have charge of beds in a hospital For the benefit of the patient and for the true advancement of radiology this was a necessity It was only at the bedside that many things became plain and by accurate daily observation of cases under treatment that new facts were discovered leading to true advancement Opposition must be expected especially from those who dwelt in the backwaters of medicine On the other hand the leaders of the medical profession at all times welcomed advances in radiology and on many occasions had stretched forth a helping hand The old French proverb, *Tout vient a point a qui sait attendre*," should be translated 'Everything comes to him who knows how to wait" In waiting the radiologist must equip himself by undergoing the training and acquiring the experience necessary to fit him for his office, remembering that if the man did not dignify the office, the office would not dignify the man

Mr C THURSTAN HOLLAND, in proposing a vote of thanks, remarked on the fact that Professor Woodburn Morison had been appointed the first professor of radiology in this country This chair in the University of London would give radiology in this country a status which it had never enjoyed before

"SANCTA SIMPLICITAS"

At a meeting of the Sheffield Medico-Chirurgical Society held at the University on October 8th, the president, Professor GRAHAM SIMPSON, delivered his inaugural address

The president after welcoming Professor Arthur Hall on his return from South Africa and congratulating him on the honour paid him by the Government in sending him as its representative to the Silicosis Conference, said that he had chosen the title of this address from an anecdote in the works of his favourite author In one of the volumes of Ernest Renan, it is related that John Hus when he was led out to be burnt at the stake noticed in the procession an old lady quite bowed down by a large faggot he expressed neither surprise nor resentment, but merely exclaimed "O sancta simplicitas" The speaker then developed his thesis, which was to the effect that all, or nearly all progress consisted in the application of this holy simplicity to the problems of life in this way they were rendered plain or uncomplicated, therefore easy to understand, and so easy to remember He illustrated this by examples of embryology throwing light on the problems of surgery and pathology, and took as instances the thyroglossal duct the developmental rotation of the primitive gut and certain aspects of the development of the eye His experience in examining had taught him that one of the defects in modern medical education was the insufficient groundwork of anatomy and embryology he compared the flooding of the student's mind with the details of innumerable diseases when the groundwork was unsound to the unsatisfactory task of trying to stand a pyramid on its apex.

Professor Graham Simpson next turned to modern improvements in diagnosis and suggested that from a medical point of view the first thirty years of this century might be named 'the age of the scopes' or the era of extended vision' He showed the great simplification brought about by the use in diagnosis of the oesophagoscope, of the bronchoscope, and of the cystoscope and illustrated the brilliant success of the last by an account of two cases of

papillomata situated at the neck of the bladder The discovery and the ever-extending use of the x rays were, he thought, a striking example of such simplification, he mentioned the case of a sinus in the temporal region which by this means was traced to the presence of an uncrupted wisdom tooth He considered that the same principle held good in the domain of treatment, and criticized the present "ritual" of surgical operations, he thought that, fifty years hence, their successors in surgery might look on much of the elaborate ceremonial of the operating theatre as indeed "ritualistic" and smile, perhaps indulgently, as surgeons did to-day when thinking of the era of the carbolic spray Of the treatment of fractures he asserted that, with one exception, the desired simplicity had certainly not been attained, this exception was the treatment of fractures near joints by acute flexion This method came within his definition of simplicity, for all that was needed was an anaesthetic, some wool, a bandage, the x rays, and some common sense, unfortunately, the absence of the last constituent had led to some lamentable catastrophes Professor Graham Simpson concluded his address by an attempt to apply this principle to some of the problems of ordinary life, and pointed out that our conception of the universe was becoming simplified, that the modern physicist's conception of the infinitely little, the atom, bore a striking resemblance to the astronomer's conception of the infinitely great

Professor ARTHUR HALL proposed a vote of thanks to the president for his address, and this was seconded by Emeritus Professor A M CONNELL

MESCAL ADDICTION

AT a meeting of the Society for the Study of Inebriety on October 14th, with Mr McAdam Eccles in the chair, a paper was read by Dr MACDONALD CRITCHLEY, junior neurologist of King's College Hospital, on mescal addiction

Dr Critchley said that during the last two or three years the police authorities of Paris and elsewhere had been perturbed by the increasing use, by certain already decadent drug addicts, of the alkaloid mescaline sulphate Mescal, or peyotl, was neither a euphoric nor an exhilarant, but it possessed in unequalled measure the property of causing hallucinations and evoking the most amazing kaleidoscopic visions The plant from which the drug was derived was a cactus, named by botanists *Anhalonium lewinii*, indigenous to the deserts of Central America, and in appearance like a small radish The dried flowering tops of this plant were used for what were known as "mescal buttons" Mescal or peyotl addiction had been known for centuries among the Mexican Indians, and for its origin one might search back into the history of the Inca civilization Terms such as the "flesh of God," the "devil's root," and the "sacred mushroom of the Aztecs" had been applied to this cactus, and to-day it was largely used ceremonially by certain Indian tribes The present knowledge of its chemistry dated from 1896, when four alkaloids were extracted from the plant, of which mescal was the most important Its pharmacological properties on animals were investigated in 1898, when it was stated that in small doses it slowed the heart rate and increased the blood pressure, and in larger amounts poisoned the respiratory centre

The chief effect of the drug on man, said Dr Critchley, was in the visual or psycho-visual sphere, and mescal intoxication showed itself in a state of prolonged visual hallucinosis, accompanied by vertigo, headache, nausea, confusion of thought, and profound disorientation, particularly with regard to time Dr Critchley described certain experiments with the drug which he and a medical friend had carried out upon themselves Some of the visual phenomena began about twenty-five minutes after 0·2 gram of mescaline sulphate had been ingested The hallucinatory images were at first simple in pattern and colour, and only visible when the eyes were closed Later they became more complicated, and no longer comprised simple geometrical designs as at first, but took a three-dimensional form, and were most brilliantly illuminated and coloured The hallucinations now became apparent with the eyes open, though never to the same extent as when the eyes were closed This bewildering state reached its maximum in ninety minutes, and persisted at this level for several hours He quoted notes which had been written by one of the experimenters, dictated during the actual seance One note read as follows

"A particularly picturesque scene, an old fashioned single-span bridge, across the upper reaches of a river, large stones by the side of the stream, and a narrow navigable channel in the middle Now there is a sort of 'close up' of the bridge which is of the old fashioned type, composed of large blocks of stone A pillar has appeared in the centre, and transformed it into a double span bridge The water now dries up, and a rocky bed becomes visible, and is gradually transformed into a stone road in a moorland scene, and still later into a meadow with buttercups and daisies, at length changing into a bandstand in a park, with chairs, each of which is whizzing round rapidly on its own axis"

An analysis of the hallucinations showed that certain forms constantly recurred, chiefly spirals, cones, lattice-work, carpet-like patterns, and so forth The visions were always brightly coloured, no one tint predominated The frequent incompleteness of the visions was remarked The contour of a figure would be almost complete, but not quite, a pattern would lack a certain element which was just, but only just, outside the field of view The emotional content of the hallucinations was expressed as amazement, interest, and delight A change in the appearance of external objects frequently occurred Newspapers and carpets looked like relief maps Stationary objects appeared to move, and regularly moving objects appeared to move jerkily The faculties of smell, taste, and hearing might be enhanced or perverted There was a description of this intoxication in the late D H Lawrence's story *The Woman Who Rode Away*, from which he quoted the following description

"So distinctly she heard the yapping of tiny dogs, the shuffle of far-off feet, the murmur of voices so keenly she detected the smell of smoke, and flowers, and evening falling, so vividly she saw the one bright star infinitely remote, stirring above the sunset, that she felt as if all her senses were diffused on the air, that she could distinguish the sound of evening flowers unfolding, and the actual crystal sound of the heavens, as the vast belts of the world atmosphere slid past one another, and as if the moisture ascending and the moisture descending in the air resounded like some harp in the cosmos"

The after-effects of the drug consisted of insomnia, vertigo, and headache The scope of mescaline in the field of therapeutics was almost unexplored The Indians used the plant for every kind of ailment, and there had been attempts to introduce it into the American *Pharmacopoeia* It had been suggested as likely to be useful in asthma, neuralgia, rheumatism, and neurasthenia There was, however, no certain knowledge as to its therapeutic properties *In the treatment of blindness* in tabes one observer had noted a temporary increase in visual acuity

In reply to a remark by the CHAIRMAN, Dr Critchley agreed that probably there was nothing fresh in the hallucinations—nothing that was not already in the subconscious mind of the individual In reply to other questions, he said that the use of mescal was not widespread, because it was extraordinarily expensive and very difficult to obtain Some individuals after taking mescal had no hallucinations He did not know that mescal addiction existed alone, but some of those who were already addicts of other drugs took mescal, as it were, in their stride It was not dangerous to life, but among observers of the Indians there was a general opinion that it was harmful physically, mentally, and especially economically, for the ceremonial debauches occurred commonly during harvest, and made the individual unfit for labour

On the CHAIRMAN inquiring whether anyone in the audience had had any experience of mescal, a lady volunteered the statement that she had taken it for three days, she did not know what amount was given her, for it was given in the form of pills, of which she had two on the first day, four on the second, and eight on the third She had no hallucinations, but she felt "gloriously happy" She was happier on the second day than on the first, and on the third day "everything was so funny that I roared with laughter the whole day long"

Reviews.

SURGICAL PATHOLOGY

Bowlby's Surgical Pathology, as it is now called, has reached its eighth edition.[1] Books on surgical pathology are not plentiful, so that the student is restricted in the choice of a textbook, but Bowlby's work has always been regarded as one of the best that a student could choose as an introduction to the subject. It was one of the first books on surgical pathology, the first edition having appeared in 1887 and it was written with the definite object of helping the students of St. Bartholomew's Hospital in the earlier stages of their work. It was at once appreciated and used, and embodying, as it does now, an experience of more than forty years, it requires no further recommendation. Its plan, as described in the preface to the original edition is excellent: "I have dealt first with the diseases as they are met with during life, and have then described their natural courses and terminations, and the morbid appearances presented by the structures involved. The nomenclature and classification adopted are simple and free from complication, and the general exposition is such as those who had the privilege of Sir Anthony Bowlby's acquaintance would be led to anticipate: clear, straightforward statement in as few words as suffice; an avoidance of doubtful and fanciful theories and of forced explanations; a leaning towards the useful and practical; and a sound and accurate prose style." Mr. GEOFFREY KEYNES, who has undertaken the preparation of the present edition, has made no essential change in the character of the work, minor alterations have been made in order to bring the work up to date, and a chapter, written by Mr. K. Paterson Ross, has been added on tumours of the brain and spinal cord, but very little of the original matter has been eliminated. The book will appeal with especial force to the students of St. Bartholomew's Hospital on grounds of personal respect and affection, but doubtless its solid qualities will ensure for it a continuance of appreciation and popularity in a wider circle.

LERICHE AND POLICARD'S Surgical Pathological Physiology[2] is written from a special standpoint, as explained at length in their preface. It is an essay rather than a textbook and is intended, not for beginners but for those already familiar with the subjects with which it deals—namely, inflammations, wounds, grafts and the diseases of bones, joints, vessels, and nerves. Its object is to encourage an attitude which is regarded by the authors as indispensable for further progress in surgery. The clinical and technical phases, they hold, are closed—we have merely to follow the teaching of our predecessors in those matters, the study of mechanisms is that which is proper to our epoch. We should henceforward regard disease and the operation that it may call for as an experiment which nature affords, the physiological consequences of which may be submitted to investigation. The method thus indicated has been followed by the authors as years and the object of their book is to illustrate its application in connexion with the diseases mentioned. Although the latter are of diverse nature a general principle connects the several chapters—namely, that the laws of tissue life govern the mechanisms of the pathological states of the tissues. These laws regard the interests of the tissues only, not those of the individual or to the latter they may be useful or harmful and it is a mistake to associate tissue function with the notion of intention. The authors consider that such expressions as "reactions of defence" and "reparative products" are not justifiable, since the tissues follow their own physiological law whether beneficial to the individual or not. Among the many interesting examples which the authors give of the application of this principle their analysis of the course of events occurring in Volkmann's ischaemic contraction may be mentioned in illustration. In this condition it is well known that a localized necrosis of the upper fibres of the flexor muscles of the digits occurs as the result of an arterial lesion. The necrosis, in itself comparatively unimportant, is followed by a progressive fibrosis of the affected area, which is seriously disabling. Investigation appears to show that the fibrosis depends on a chronic congestion within the area, exaggerated by the enclosing aponeurosis, as proved by the amelioration which follows wide incision of the latter. The root of the mischief, however, is found to lie in a vasomotor reflex originating in the arterial lesion, if this reflex is eliminated by removal of the lesion (practically a sympathectomy) the fibrosis will be arrested, and, if not of too long standing, will retrocede and no disability remain except that due to the original necrosis. A case in point is mentioned in which a typical Volkmann contracture following a fracture with rupture of the brachial artery was almost completely removed by excision of the arterial stump six months after the injury. The book is interesting from beginning to end.

FUNDAMENTALS OF DIAGNOSIS

To readers who enjoy the discussion of fundamental principles and recognize the possible slavery which words, unresisted, may inflict upon our minds, we can commend Dr. F. C. CROOKSHANK'S small volume *Individual Diagnosis*.[3] To read that there is an essential difference between the ambition to cure *disease* and the ambition to cure *diseases* may to the passer by seem to be a hair-splitting business. Yet it is the proposition which Dr. Crookshank's pages are directed to sustain, and the claim is made that on the recognition of it rests not only a right attitude towards medicine in general, but also a wise direction of therapeutic activities.

At the basis of the discussion is to be found the familiar word "diagnosis," and the consideration of this term leads into important pathways. Thus, included in the elementary instruction given to the future practitioner of medicine is the engaging maxim that diagnosis must necessarily precede treatment. Equally the pupil is urged to remember that when the time for treatment has arrived it is the patient, and not the patient's disease, that must be the object of his therapeutic activities. Clearly, then, an understanding of what is meant by "diagnosis," is of the first moment. Does the word mean a knowledge of the patient as an individual, or merely an identification of the pathological disturbance of which, apparently, the patient is the victim? If the latter, how can diagnosis equip the practitioner to treat the patient? Yet it is largely in this restricted sense that the word appears in medical textbooks and lectures—that is, it is taken to mean in substance the detection of a pathological condition or disease which the patient has "got," and which itself exists somewhere in a typical form, though often lamentably atypical on the mundane level. The contrasted definition is that diagnosis implies a thorough knowledge of the individual patient alike on the negative and on the positive side. Hence, given accurate observation a diagnosis is never wrong, though an opinion founded on the diagnosis may be wrong. And this to some will be a hard saying.

What we write here is only a rough illustration of the discussions which are included in Dr. Crookshank's chapter entitled "Diagnosis and the Syndrome," while in the second chapter, named "Organ-Jargon," the claim for thorough knowledge of the patient is carried from the physical to the psychological level. The argument is no mere verbal dexterity, but is directly related to practical ends, and the study of it is a bracing intellectual experience. It pretends to go, and does go, to the root of things. Perhaps here and there the allusions are somewhat subtle but judged on the literary and the book has a decided air of distinction. Dr. Crookshank has had some influential predecessors but the doctrine they have preached has never been a popular one; all the more reason that the text should be repeated in an age which is a rather hurried one for the philosopher.

DISEASES OF THE NOSE AND THROAT

THERE is a vast amount of work in diseases of the nose and throat carried out as a routine in out-patient departments and by general practitioners For this work the faculty of rapid and accurate diagnosis, and the ready application of appropriate treatment, have to be acquired The *Manual of Diseases of the Nose and Throat*,[4] by Dr CORNELIUS COAKLEY, can be recommended as a reliable guide for this kind of work It has stood the test of time and has achieved a seventh edition, which in itself is a sufficient testimony to its worth Care has been taken to provide a full description of medical treatment and of the various minor operations All the operations on the nose and accessory sinuses are described in a lucid fashion There is, however, still some matter which might be *eliminated to make room for the new* Chronic subglottic laryngitis is a conspicuous example of a diagnosis which has had its day and should be omitted, for it is a diagnosis only, and corresponds to no actual pathological condition The bulk of the book might be reduced by a strict revision of this kind, but it is a safe guide for house-surgeons and clinical assistants beginning work in a special department, for it provides fully just the information required

DEVELOPMENT OF THE CHILD

THE fifth edition of Professor KARL BUHLER'S book, *The Mental Development of the Child*,[5] has been translated from the German by Oscar Oeser The earlier sections deal with the differentiation of instinct, training, and intellect, and with the stages at which the developing human infant begins to show its mental superiority to the higher animals In later chapters the development of language, of the perceptions of time and space, size, shape, and number, is discussed, and in an extraordinarily interesting section the psychological importance of fairy tales is analysed The development of drawing as a means of expression, the evolution of thought and judgement, and the beginnings of social behaviour form the matter of the final chapters The subject is a fascinating one, and receives an added interest from the suggestions thrown out by Professor Buhler that it has an important bearing on the developmental history of the human race He points out that our observations of young children are still incomplete, and offers many illuminating suggestions for further lines of research The book is intended for students and teachers, and is a summary of a larger work, it is admirably written and translated, and covers in detail the gradual emergence of the child from the animal state to human consciousness Throughout it is illustrated with concrete examples, of which the significance is always discussed fully and impartially, and it should form a valuable scientific background for those undertaking the study of child psychology

Child Adjustment in Relation to Growth and Development,[6] by ANNIE DOLMAN INSKEEP, though rich in interesting material, is perhaps discursive rather than exhaustive The book is an elaboration of a series of lectures, and the slightly colloquial style makes agreeable reading Mrs Inskeep has had a wide experience of young children, both at home and in the class-room, and her book is intended for the use of school teachers and officers, parents, and social workers who come into contact with children The early part of the book is concerned largely with the physical development of the child in height and weight, musculature, and co-ordination, especially in relation to right- and left-handedness The importance of age as a variable anatomical and physiological factor is discussed, and the teeth, the development of the brain, the eye, and the ear are each the subject of a separate section In writing of the eye Mrs Inskeep emphasizes the immature development at the time of the first attendance of the child at school, a point which is too often overlooked The adjustment of the home and school to the physical growth of the child and the development of the mind and the measurement of intelligence by various types of test are dealt with at length, and the three final chapters cover adjustment during the pre-adolescent and adolescent periods, the emotional health of the child, and mental hygiene in the school A brief appendix gives some tabloid information on the behaviourist theory, the Gestalt-theorie, Freud, Jung, and Adler, and psycho-analysis The book embodies much excellent material in the shape of observation and experience, *but the continual appeal to tests of* one sort or another is likely to receive less enthusiastic support from the English than from the more energetic and perhaps more ingenuous American mind At all events the grave suggestion that the inherent emotional trends of young children should be tested by an analysis of respiratory and blood pressure changes recalls Chesterton's story of the man mistakenly interrogated on the charge of being his own murderer, at the mention of his own name his pulse record, not unnaturally, showed a violent leap Confronted with the infinite number of variable factors which constitute a human being this desire for wholesale standardization may as yet stand abashed

GONORRHOEA IN THE MALE

THE success of the first edition of Dr A L WOLBARST'S *Gonococcal Infection in the Male*,[7] which was noticed in our columns on January 21st, 1928, has resulted in the appearance of a second This is far from being a reprint, since it contains new matter, important changes in many of the chapters, and the addition of numerous new illustrations The fact that the author regards gonorrhoea as a constitutional rather than as a local disease gives a special importance to the section dealing with constitutional therapy In the previous edition a special chapter was contributed on chemotherapy by Mr J E R McDonagh, but in the new edition its salient points have been incorporated in the rest of the work

In considering posterior infections, Dr Wolbarst draws attention to the necessity of arriving at a precise diagnosis by means of posterior urethroscopy, and as an assistance to the reader he has reproduced numerous plates of posterior lesions affecting the verumontanum and the orifices of the ejaculatory and prostatic ducts. These plates have been prepared by photographing wax models made by the author himself It has long been said that the verumontanum is a mirror which reflects the condition of the seminal vesicles, and Dr Wolbarst's atlas of pathological changes that may be noted in its appearance will be of great use to those who are not expert in the use of the posterior urethroscope In speaking of the treatment of chronic vesiculitis, the author considers that Belfield's operation is one of the most valuable therapeutic measures at our disposal He endorses Belfield's view that at least 80 per cent of cases can be cured by this means It is difficult to understand how such discrepancies should exist in the opinions expressed by different authorities on this subject The technique of the operation is so simple that disappointing results cannot be explained by a failure on *the part* of the surgeon to carry out the operation in the correct manner But in spite of any hesitation the reader may feel in accepting the author's optimism on this point, it is an advantage rather than a disadvantage that a writer on gonorrhoea should adopt an optimistic rather than a pessimistic attitude towards his subject

The mental effect of perusing *Gonococcal Infection in the Male* is to stimulate one to approach this somewhat disheartening disease with a new optimism It is essentially a tonic to the jaded venereologist

NOTES ON BOOKS

We welcome the eighth edition of SAVILL's *System of Clinical Medicine*,[1] which has appeared within five years of the last (see *Journal* 1925 ii 1131). The present edition, like its five predecessors published since Dr Thomas Savill's death has been edited by his widow Dr Agnes Savill, assisted by a number of specialists. The chapters on diseases of the lungs and liver have been revised as well as the sections on the pancreas, mental disease, urinary examinations, clinical bacteriology and serum therapy, and much of the chapters on debility and the nervous system has been rewritten. The completely new matter includes, among many other subjects, coronary thrombosis, quinidine treatment, insulin coma, liver therapy, malarial treatment of general paralysis, Schilder's disease, pyknolepsy, methods of localization of cerebral and spinal tumours, and some rare skin diseases. As in the last edition the chapters on diseases of the heart have been revised by Dr Strickland Goodall, diseases of the lungs by Dr Reginald Hilton, diseases of the stomach and liver by Dr S. W. Patterson, tropical diseases by Dr Byam, fevers by Dr J. D. Rolleston, diseases of women by Professor Louise McIlroy, diseases of the nose and throat by Mr Philip Franklin, and diseases of the ear by Sir James Dundas-Grant. As the result of exclusion of obsolete matter the work, in spite of so much new material, has been enlarged by only twelve pages. The editor and her collaborators are to be congratulated on having brought the present edition of this deservedly popular work well up to date.

A book on massage by two directors of physiotherapeutics is not likely to minimize the importance of the subject. The small book on Massage and Re-education,[2] by Drs DUREY and MEUPE is a case in point. It includes most that it is necessary to say on the subject and even goes beyond it in the prescription and description of uterine massage.

The seventh edition of *Lippincott's Quick Reference Book for Medicine and Surgery*,[3] which appears just two years after the last, has been revised throughout. The articles on appendicitis, hay fever, nephritis, and eye diseases have been rewritten, and numerous other additions have been made to bring the work up to date.

The *Abstracts of Dissertations Approved for the Ph.D. M.Sc. and M.Litt. Degrees in the University of Cambridge for the Academical Year 1928–1929*[4] consist of brief synopses of studies in agriculture, botany, geology, zoology, biochemistry, physiology, mathematics, chemistry, and physics, besides history, literature and economics. Among the theses of interest to the medical profession are "Dynamic changes occurring in man at work" and "A paper on a peculiar carbohydrate metabolism which discusses the results obtained from a study of the action of insulin *in vitro*, the nature of blood sugar, and the relationship between lactic acid and carbohydrate in the mammalian liver."

Lipreading[5] by IRENE R. EWING reminds us of how much has been done in recent times for the relief of the deaf mute. The author who has taught lipreading for over twenty years emphasizes its importance as a method of communication and the unflagging attention necessary to establish it. She explains in the first part that lipreading is of psychological as well as of practical value to the deaf adult, dissolving with new hope the introspective melancholy and isolation of his state, and demanding concentration from his slackening mental activities. The partially deaf find that it helps out their hearing and conserves the distinctness of their speech. Quick wits rather than analytic intelligence are needed for acquisition of the art. But progress comes only by constant application to different types of speech. The second part contains hints for friends of the deaf and for students of lipreading. Teachers are advised to study the temperament and mental aptitudes of their pupil. Mirror practice, repetition aloud of words understood, and practice papers are all helpful. The third part deals sympathetically with those children who, born deaf, are cut off from the conception of words. Mrs. Ewing holds that the first efforts at lipreading must be directed towards the development of a watching attitude, and that the words chosen should refer to objects and actions in which the child is really interested; even if the plan of the teacher's lesson is thereby disturbed. She deprecates finger spelling as a deterrent to the regular exercises of lipreading. One feels that in the initial phases of this difficult work the teacher must develop a power of attention so acute as to approach suggestion. *Hear with your Eyes*[12] by M. E. GOOD, is an interesting but entirely technical study on the memorizing of sounds from face forms. Vowels, consonants, and syllables are minutely described in their muscular effects; expressive illustrations and exercises being supplied for elucidation.

If *Lascar Hindustani for Ship-Surgeons*[14] by Dr S. CHALMERS PARRY turns out to be more helpful to those who already have some knowledge of the language than to novices it will be no fault of the author's; this is a defect common to all phrase books, and there seems no getting round it. The questions from doctor to patient have been thought out with great care and as long as the patient answers them as he is intended to answer them, with a "Yes" or a "No," difficulty is not likely to arise. The real trouble is that he may start talking. Lascar Hindustani back to the doctor. If we may make one suggestion for improving this excellent little manual it is that in the next edition the author should include a brief account of the phonetic principles he has adopted and a key to pronunciation.

PREPARATIONS AND APPLIANCES

A PNEUMOTHORAX APPARATUS

DR. GEOFFREY MARSHALL (London, W.1) writes: The apparatus here illustrated is a modification of one described in 1921. In my former model the air reservoir consisted of a collapsible india-rubber bag. This has now been replaced by a glass cylinder graduated up to 600 c.cm. The lower end of this cylinder communicates by flexible tubing with a stout rubber bag of the hot-water bottle type. This bag is of the same capacity as the cylinder, and is filled with water. When ready for use the bag is suspended by means of a knotted silk cord as shown in the figure, and on turning the glass two-way tap the water runs into the lower end of the glass cylinder displacing the air which is driven into the flexible tube attached to the needle. The rate of flow is governed by a screw clip at the top of the cylinder. There are three glass bulbs containing sterile wool to filter the air, and a trap prevents loss of water from the manometer in the event of the patient coughing during the operation. Fitted in the case are four bottles of novocain iodine solution, etc., also room for pneumothorax needles and syringe, for injecting the local anæsthetic. The manometer registers intrapleural pressure or pressure at which the gas is being injected, according to the position of the two-way tap. The apparatus can be used for both injection and withdrawal of measured quantities of gas and its advantages are that it is easy to handle, is light and compact and it can be carried in any position. The weight of the apparatus is 7¾ lb. and the measurements of the case are 19¼ × 9 × 4½ in. It is made by Messrs Down Bros., Ltd., St. Thomas's Street, S.E.

British Medical Journal.

SATURDAY, OCTOBER 25TH, 1930

VACCINATION WITH BCG

Now that the congresses of Paris, Oslo, and London are over, it may be worth while to review briefly some of the more important observations made on the B C G strain, which came up for discussion both in and out of session. In doing so we shall omit all reference to the Lubeck disaster, the official inquiry into which is still proceeding. The facts at present available are confused and somewhat contradictory, and we do not wish by putting forward premature explanations, to prejudice the issue in any way.

In the absence of reliable statistical data on the effect of B C G vaccination of human beings, many workers have devoted their attention to a more careful study of the strain itself. It will be remembered that Petroff[1] succeeded in demonstrating in the B C G strain two different types of colony: one which he called the R type, was avirulent on subcutaneous injection into guinea-pigs, while the other, which he called the S type, and which was present in far smaller numbers, was stated to be capable of giving rise to generalized tuberculosis. Careful study of Petroff's protocols renders it doubtful how far his conclusions on the virulence of the S type are justifiable. After subcutaneous inoculation of guinea-pigs with about 1 to 3 mg. (moist weight) of bacilli, death was not invariable, nor were the lesions at necropsy always severe and extensive. As for rabbits, intravenous inoculation of even large doses, 15 to 30 mg., was often borne quite well, and in the few rabbits that did succumb, the lesions were confined to the lungs and kidneys. As is well known, very similar results may be obtained by the use of dead bacilli, which, though naturally unable to set up infection, are nevertheless capable of giving rise to tubercle formation. It seems quite clear that the virulence of the S type was definitely below that of a standard bovine strain. The employment by Petroff of relatively large doses may explain why some workers, notably Gerlach,[2] have *failed to confirm* his findings on the virulence of the S type, even when using his own cultures.

If these results stood alone, it would be unwise to lay too much stress upon them. But during the last two years several workers have either confirmed certain of Petroff's results, or have brought corroborative evidence to indicate that his main contention regarding the essential heterogeneity of bacillary type in the B C G strain is correct. Not only has the existence of two colonial forms been demonstrated in numerous laboratories, but the conversion of the practically avirulent whole culture into a highly virulent culture has been accomplished both by passage through guinea-pigs and by certain *in vitro* procedures. These results, most of which are still unpublished, leave no doubt that the virulence of the B C G strain is capable under suitable conditions of being exalted. They are all the more convincing because of the close agreement which they present with observations made of late years on other micro-organisms, such as the pneumococcus, the streptococcus, the fowl-cholera bacillus, and *B. aertrycke*. Generally speaking, when a strain of one of these organisms, as the result of repeated subculture in the laboratory, loses its virulence, it is found that the initial, virulent, smooth bacteria have been replaced by avirulent rough bacteria. During the actual process of transformation, the evidence suggests that the rough organisms make their appearance, and gradually increase till they eventually replace the smooth organisms more or less completely. So long as a certain proportion of the smooth type remains, the whole culture may prove virulent, but once this proportion has dropped below a certain level, its virulence falls. Provided the replacement has not gone too far, it is often possible by suitable means, such as animal passage, to restore *the full virulence to a culture that has become almost avirulent*. This restoration seems to depend on an increase in the proportion of the smooth to the rough *organisms in the culture*.

The analogy which the B C G strain presents with attenuated strains of such other organisms as have been mentioned is a very striking one. There is general agreement that this strain, though highly attenuated, is not completely devoid of virulence. Petroff's demonstration that it contains two types of bacilli, one avirulent and the other possessed of at least a certain degree of virulence, together with the findings of Watson and others that its virulence can be restored by animal passage, affords sufficient proof of the incorrectness of Calmette's contention that its virulence is fixedly and permanently attenuated. If this conclusion is accepted, it follows that the administration of this vaccine to human beings is fraught with some degree of hazard. It is true that B C G has so far been used to vaccinate something like 400,000 infants without any apparent deleterious effect, but the fact remains that the danger of its reversion to a more virulent type, particularly under altered conditions of cultivation, cannot be regarded as insignificant. Its use in practice is therefore a question of expediency. In the face of such a widespread disease as tuberculosis many authorities consider it justifiable to incur the necessary risk, judging this to be very much less than that of active tuberculosis. On the other hand, several workers are so impressed with the dangers inherent in the use of living vaccines that they prefer not to use the B C G strain at all.

The case for the supporters of B C G vaccination would be very much stronger if only animal tests had given unequivocal results, but unfortunately these have so far been disappointing. The experiments carried out by Watson[3] in Ontario, Rankin[4] in Alberta, Larson and Evans[5] in Illinois, Schroeder and Crawford[6] in Maryland, and Haring, Traum, Hayes, and Henry[7]

in California involving the use of over three hundred cattle indicate that vaccination with the B C G strain cannot render the animals fully resistant to infection either when they are submitted to artificial inoculation or exposed to natural sources of contamination. There is evidence that the development of the tubercle bacilli within the body may be retarded for some time, but even with revaccination this increased resistance proves but transient, and the disease in the vaccinated animals develops ultimately very much the same way as in the controls. In Europe the vaccine has been used for cattle chiefly under field conditions and the difficulty of obtaining exact numerical results is nearly as great as with human beings. Ascoli in Northern Italy maintains that it has brought about a very marked decrease in mortality but this is not altogether supported by the figures he supplies. In any case since the vaccine has been used for only about four years it is too early to judge its prophylactic value: the incidence of tuberculosis in calves heifers, and young cows is very low and it will be necessary to wait for at least another five years before its preventive action can be at all accurately assessed. Until further and more extensive experiments have been carried out on animals and until these have been attended by uniformly favourable results it will appear to many that the conservative attitude so far adopted by the medical and veterinary professions in this country towards vaccination with B C G has been not altogether unjustified.

CHRONIC ABDOMINAL DISORDERS

THE chronic abdominal disorders of which visceroptosis is a type have given rise to much discussion and to the production of an extensive literature. The patient complains of general weakness and more or less constant abdominal discomfort. There is a susceptibility to catarrh and to muscular pains of a fibrositic nature and vasomotor symptoms are common. But the predominant symptoms are related to the abdomen—discomfort or pain flatulence constipation capricious appetite. The patient soon develops an introspective habit of mind and the variation of symptoms becomes noted and analysed and tends to be ascribed to trivial changes in food weather or social environment. Objectively the physician can find little more than under nutrition and an over reaction to stimuli of all sorts so far as can be judged there is no serious abdominal condition present. The persistence of symptoms however leads to disquietude in the mind of the physician lest something has been missed and this disquietude has crystallized into various theories of causation.

These theories are discussed fully by Dr. H. Bedinghold in his book on *Visceroptosis and Allied Abdominal Conditions Associated with Chronic Intoxication*. The earliest in point of time was that of visceral displacement. This theory culminated in Glenard's [illegible] that the symptoms were caused by the dragging due to visceroptosis. This purely mechanical cause had to be abandoned when x-ray examination showed how variable the position and tone of the hollow viscera may be in health. Lane introduced the theory that the visceral displacements produced a kink in various portions of the alimentary tract which resulted in intestinal contents might occur but such factors as ideal stasis duodenal ileus and stagnation in a dilated elongated pelvic loop cannot be accepted as sufficient explanation. Equally with these anatomical theories variations of secretion and of nervous control of the intestinal tract appear to be inadequate. Following on the idea that stasis encouraged absorption of poisons from the bowel contents search was made for these poisons but so far no such poison has been obtained from either bacterial or chemical products recovered from the intestinal contents. What little of poisonous nature is absorbed from the bowel is detoxicated in the liver though it is possible that further work on vitamins may demonstrate that vitamin deficiency is responsible for varying absorption from the intestine.

In most of the patients constipation is a leading symptom. Constipation may be either atonic when there is sluggishness of the whole colon or spastic with delay in the lowest part of the colon but autointoxication and constipation are not necessarily related. Indeed none of these factors appears to be enough. There seems to be an underlying constitutional deficiency usually congenital and inherent but at times acquired through the stresses of life anxieties or illnesses. Two types of patient may be differentiated the one cheerful, energetic but under engined who works till she drops the other querulous and fretful, suffering from a sense of inferiority and using the symptoms of chronic invalidism as a means of obtaining a measure of sympathy and attention that could not be claimed through merit. Dr. Bedinghold analyses his own cases (he found 152 of the latter type among 1,200 consecutive patients) in an able way and this part of the book will be read with interest and benefit by all who have to deal with similar patients. Treatment consists primarily in the improvement of physical health by diet rest exercise and the removal of any sources of minor infection or irritation. But medical measures alone will fail just as abdominal surgery has failed. Without a broad view of the patients constitutional disabilities and the social and psychological factors involved the physician cannot give the sympathy and encouragement that is necessary to help these patients to minimize the unfortunate consequences to them of over responsiveness of the abdomen.

Mucous membranous colitis a common variety of chronic abdominal disorder characterized by spastic constipation spasmodic abdominal pain and flatulence and the passage at intervals of strings of glairy mucus per rectum is the subject of a little book by M. Chiray and R. Stuffel. This condition is not really a colitis though a secondary colitis or putrefactive or fermentative nature may supervene. The underlying state according to the authors is essentially a neurosis on the basis of a neuro-arthritic diathesis with a vagotonic symptoms and is usually associated with some endocrine disorder such as hypothyroidism and ovarian insufficiency. In the absence of complications therefore no pathogenic condition is found in the abdomen. The treatment consists in attention to general health and can often be started best at a spa. Diet should be of such a nature as to give the colon a residue to work upon but much roughage is not always well borne. Liquid paraffin alone or in emulsion with agar or psyllium seeds and five c.c. of atropine for the constipation and courses of atropine for the spasm.

AMENTIA

A most valuable collection of records and publications on amentia has been presented to the Library of the Royal College of Surgeons of England by Dr Thomas Brushfield, who was formerly in charge of the Fountain Hospital for Imbeciles at Tooting, under the Metropolitan Asylums Board The records comprise the detailed histories which Dr Brushfield compiled of all the children who came under his charge from his appointment in 1914 till his retirement in 1927, with photographs of the children taken on admission and after treatment The histories are classified by the types of amentia—mongolism, cretinism, microcephaly, etc—and Dr Brushfield has preserved elaborate details, not only of each child's physical condition and family history, but of the mental tests employed in each case, and of the progress of such as were fit to attend school All these records are fully indexed, and numerous tables have been drawn up summarizing and analysing the material from various aspects These histories and statistics, covering so considerable a period from the time when the particular study of mentally deficient children was only beginning, are all the more valuable in that they have not been continued on any such scale as was undertaken by Dr Brushfield He has presented them to the College Library in Lincoln's Inn Fields so that they may be readily accessible for any research worker in this subject, for whom they ought to prove of inestimable value, as there is no comparable collection of similar material available But besides his first-hand records Dr Brushfield has also presented his very large collection of papers and cuttings on amentia, gathered from all over the world These will be kept together in connexion with Dr Brushfield's own records, and the donor has prepared a full index to them The papers cover not merely the varieties of amentia, but whatever may possibly have a bearing on the subject, and there are numerous entries *in the index under such headings as birth, encephalitis,* endocrines, skulls, etc To complete the usefulness of the collection, Dr Brushfield has compiled a bibliography of books and articles issued up to the present on all the subjects covered by his index of which there is no copy in his collection He further very generously proposes to keep this bibliography up to date, and to incorporate into the collection whatever publications he may continue to collect It is greatly to be hoped that there may be workers who will be glad to avail themselves of this carefully prepared material May it also be hoped that some of them will care to continue the collecting of this special literature, which Dr Brushfield has so industriously and disinterestedly begun

SPECIALISM AND RESEARCH IN THE SERVICES

The United Services Section of the Royal Society of Medicine draws its presidents in rotation from each of the three Services This year it is the turn of the Navy, and Surgeon Commander S J Dudley, who assumed the presidential office last week, delivered from the chair a thought-provoking address on the opportunities which the Services, especially the Navy, afford for specialism and research He said that as a result of the growth of medical knowledge the profession of necessity split up into an ever-increasing number of specialisms The advantages of specialization were self-evident, but there were disadvantages The highly specialized doctor was closely adapted to one particular type of environment in which he greatly outshone the general practitioner, who was, however, much more at home in every other type of environment In certain subjects early specialization seemed to induce an actual pride in ignorance of general medicine and surgery In the Navy there was not work for many whole-time specialists, because there were not enough special cases The narrowing effect of specialization could be avoided, by refusing to let the naval officers specialize too much before attaining their half-stripe One excellent naval custom was that all surgeon commanders should serve a commission at sea before further promotion This custom was unpopular, but for the good of the Service he hoped it would continue to be rigorously enforced, especially with regard to those officers who specialized in administration Many hospital doctors and administrators who had been long ashore forgot how rapidly the modern Navy had changed and was changing The specialist it wanted was a man with at least the average knowledge of general medicine and surgery, and with an expert training in some specialty in addition thereto, but not in place thereof Moreover, if the Service was to obtain the best results from its medical experts, naval specialists must be familiar at first-hand with the conditions of life and duty in ocean-going submarines and triple 16 in gun turrets Surgeon Commander Dudley went on to say that the Services offered one of the finest fields for any man who had a liking for research but was not enthusiastic enough to slave out the best part of his life on £200 or £300 a year in a laboratory ashore He would find, in the Navy especially, many opportunities of original investigation Of course, he would have to remember that his Service duties as practitioner of curative and preventive medicine always came first, that he was not asked to do research, nor paid to do it But if he did research, he would always find plenty of encouragement from those in authority over him, and probably also from his material, the ever-cheerful sailor As a matter of fact, in the Services original work had been recognized and rewarded to an extent greater, he thought, than in civil life To many minds research conveyed the idea of test tubes and incubators in laboratories, but that was not the *only, nor* even the most important, kind of research in progressive medicine *The Services offered an ideal field for statistical* investigation, for clinical as distinguished from laboratory research, and for research on epidemiological problems They were, in fact, the happy hunting ground and the last stronghold of the amateur research worker, whose day elsewhere was practically over It was to the Service man a pastime, and if some useful result emerged so much the better, for he would never agree with the dying words of an eminent professor, "Thank God, I have never done anything useful" Surgeon Commander Dudley gave a number of instances of the kind of domestic conundrums which came before the medical officer in the Navy—for example What is the best way of airing bedding in a destroyer or small cruiser during a continuous spell of bad weather? Why is the sailor so fond of patent medicines, and what effect have they on him? What are the psychological influences which determine happy and unhappy ships? Turning to the question of publication of results, the president expressed himself strongly on the need for maintaining certain standards of accuracy and making a proper use of authorities He also protested against the way in which tradition and authority might hinder progress in knowledge There was always a strong instinct to worship *dead leaders, and the medical profession* was no exception to this His own contention was that all traditions and hoird customs, however admirable, needed constant overhauling He also gave some instances of statements, persisting in edition after edition of popular textbooks, which could have been refuted by the most ordinary observation As Sherlock Holmes said to Watson, "It is a capital offence to theorize before one has data" The testing of comparing of therapeutic or prophylactic agents was specially liable to the *post hoc* fallacy There was only one reliable method of testing therapeutic or prophylactic treatment—namely, to take the admissions as

they turned up in hospital or sick bay and treat alternately, one by the old procedure and the next by the new, until a sufficiently large number of results were available for analysis. The Service category 'P U O' had been the subject of witticism, but it had everything to recommend it. It was honest, and it did not vitiate any conclusions the statistician might be trying to draw from sickness records. If progress was to be made in prevention and treatment, the diagnosis must approach certainty, and all doubtful syndromes must be reported as such and closely described.

KUMMELL'S DISEASE OR COMPRESSION FRACTURE OF THE VERTEBRAE

At the meeting of the French Surgical Congress on October 6th a report by Drs. Froelich and Mouchet was read on the subject of Kummell's disease (or "maladie de Kümmell Verneuil," as the French prefer to call it). In this country there is still difference of opinion as to the occurrence of rarefying osteitis of vertebræ after injury, apart from fracture, especially compression fracture. The case of which Dr. Louis Mencière of Rheims gave an account in the discussion following on the report seems to be admissible equally to the category of fractures or of osteitis, so far as the account given enables us to judge. A lad of 18 years of age who was employed in driving a motor tractor in agricultural work, in order to reach the driver's wheel had to bend his body forwards, in which position he was subjected to repeated violent bumps as the tractor passed over inequalities of the ground. Dr. Mencière found at the level of the tenth dorsal vertebra traumatism, and the development of rarefying osteitis of the vertebral body. The case is of interest whatever its pathology, as introducing what may be a novel manner of injury of the spine, and it also has interest, as Dr. Mencière says, from the point of view of accident insurance and employers' liability and compensation.

PERIODICAL HEALTH EXAMINATIONS

From October 15th to December 31st, 1929, an extensive educational campaign in the interest of periodical health examinations was carried out in greater New York by the local medical societies, and the report on this campaign and its results has now been issued. Most of the organization of previous efforts to interest the public in these overhauls has been in the hands of voluntary health bodies or social agencies outside the medical field. Last year's campaign in America was unique in that the medical profession carried out its own campaign, and the full page advertisement with which preliminary proceedings began established the precedent of 'collective advertising" by the profession without any weakening or the prohibition of advertising by individual doctors. This advertisement, by its slogan 'Go to your doctor before he has to come to you," indicated at once the scope of the campaign, and Dr. John A. Hartwell, president of the New York Academy of Medicine, in his preface to the report, indicates the main lines of the policy which was followed. The committee in charge raised the necessary funds from insurance companies and various voluntary health associations, and over a period of two and a half months the public of New York City had its attention directed in a very emphatic manner to the advisability of periodical examinations by the family doctor. The lay press, churches, the schools, many of the business organizations, wireless, and cinematograph, all played a part in preaching the simple gospel of keeping healthy by stopping disease at an early stage. The report states that 130,042 words were sent out to the press and in other ways used in the publicity of the campaign. The mayor of New York issued an official proclamation, all the newspapers printed editorials on the subject of health examinations, and all the churches were asked to set aside November 22nd and 23rd as health examination days. A simple pamphlet entitled "Pity the Poor Ostrich" was widely distributed by doctors among their patients and by employers among their workpeople. All the details of the campaign including an intricate time-table of the various features, are given in the present report, which also includes a candid section on the projects which failed. In conclusion there is an attempt at estimating the value of the campaign. Obviously the immediate results could not be expected to be very remarkable, for to move public opinion on a matter like this requires years of sustained effort. Nevertheless, the answers to a questionary addressed to a representative group of doctors revealed a 25 per cent. increase in the number of applications for health examinations during the period of the campaign. Nearly 80 per cent. of the doctors who replied were impressed with the value of the attempt to interest the public in this subject, and 85 per cent. believed that the campaign would have been more effective if continued over a longer period of time. A notable feature of all the public pronouncements on the subject of health examinations was the insistence on the family doctor as the proper person to make the examination. Dr. A. J. Rongy, the chairman of the committee, wisely remarks that one of the underlying motives of the campaign was to attempt to stem the present drift of the public away from the family doctor. This fact and the "collective advertising" by the profession stamp last year's efforts in New York as worthy of close examination by the profession in other countries.

WELFARE SCHEMES IN INDUSTRIAL FIRMS

In the past commercial firms could urge against schemes of industrial welfare that they were too expensive, to-day such a plea would have little data to support it. The Industrial Welfare Society has recently published the outline of a scheme[1] which shows that most welfare activities cost little or nothing, and that they may safely be introduced into firms of any size with success. Protection against sickness, unemployment, and old age is the object sought by every wage-earner who joins clubs and benefit societies, but cases are not rare, unfortunately, in which these agencies fail, with consequent loss of the savings of contributors. A savings fund controlled by the firm can simplify thrift for the worker by deducting, at his own authorization a part or his weekly wage for the fund, it has the additional advantage that the security of the firm is behind it. Under some of the schemes suggested the employer encourages the worker to save by supplementing his savings that is to say, when the employee has bought an agreed number of savings certificates the firm gives him an extra one, or the employer guarantees a given rate of interest higher than the bank rate. It is sometimes unwise for the firm to offer bonuses or additions which are merely credited to the employee, for in one case recorded the firm became insolvent and the workers lost their bonuses which had never actually been set aside. It is possible for the firm to supplement savings schemes by funds for sick benefit and by holiday funds at a good rate of interest without being involved in excessive outlay. Similar methods can be followed in establishing a pensions fund, allowance being made for the proportion of elderly men in employment at the time. The value of these schemes to the employer is in the closer link they forge between the firm and the workers and in the increased efficiency of workers, who have less desire to change their employment. The pension funds moreover, provide an acceptable method of superannuation when a man becomes incapacitated by

[1] *The Introduction of a Works Welfare Scheme.* 1930. Published by the Industrial Welfare Society (Incorporated) 51, Palace Street, Westminster, S.W.1.

age from performing his work, the State encourages those contributory schemes by exempting the invested income of pension funds from taxation, and, in addition, a firm's annual contribution to a benevolent scheme is free of tax The suggestions of the Industrial Welfare Society are extended to cover accident prevention, care of the workers' health, recreation, and educational programmes The field may sound optimistically wide, but the aim is to make every scheme self-supporting as far as possible A year's total expenditure on a welfare scheme by one firm of engineers employing 700 workpeople was only £647 19s 6d, a sum which included a salary of £500 for a welfare supervisor, the average cost estimated by twelve other firms was £1 per head per annum To a firm of 4,000 employees the allocation of 1d per day per worker would provide a welfare fund of more than £5,000 yearly, which would cover the salaries of the supervisor, ambulance room attendant, and groundsman, as well as contributions to a benevolent fund Such an estimate places welfare schemes within the power of even small firms

THE TRAFFIC IN NARCOTIC DRUGS

THE current number of our well-informed contemporary, the *Police Journal*, which appears under a new editorship, contains two articles dealing with the traffic in dangerous drugs, and the administration of regulations contrived for the restriction of illicit commerce therein Mr A H Sinks, chief of the Rotterdam police, who has been appointed an assessor to the Opium Advisory Committee at Geneva, contends that while "ordinary crimes injure either physically or materially a single individual or a comparatively small group of individuals, opium offences threaten the welfare of whole nations and cause untold injury to national health" He insists that "the havoc caused by the drug curse must be laid at the door of the illicit drug traffickers, who are guilty of one of the gravest crimes against mankind" He dwells on the world-wide nature and international organization of the smuggling of opium, morphine, cocaine and heroin, and cites the well-known case of Egypt with some half-million addicts out of its population of 14 million From Europe large illicit consignments of the drugs have been traced not only to Egypt, but to Mexico, the United States, Canada, and to the Far East, while from the Persian Gulf and from China a considerable contraband trade in opium proceeds to India, Indo-China, and the Far East It would be difficult to contend that, notwithstanding all the efforts by way of conventions, conferences, commissions, and legislation of the last ten or twenty years, there is less illicit traffic in dangerous drugs than there was before the campaign against the abuse thereof was first embarked upon Mr Sinks alludes to the policy of limitation of production of the drugs in question, on which subject a preliminary conference is to be instituted in London next week While admitting that limitation of production would "prove a radical expedient" Mr Sinks does not appear to regard it as the most decisive factor It is true that to be really effective universal co-operation of all producing countries would be essential, and so long as countries like Turkey, Persia, Bolivia, and Peru either do not adhere to the conventions, or refrain from their effectuation, it will be impossible to stop the evil at its source The manufacture of the dangerous alkaloids can be more closely circumscribed and controlled than the growth of the poppy or the coca plant, and presents a problem which should not defy concerted pressure exercised through the League of Nations To the same number of the *Police Journal* Mr C H L Sharman, chief of the Narcotic Division of the Public Health Department of Canada, contributes an interesting article on narcotic control in that country He claims that since 1908 Canada has built up a system of control which is "the equal at least of any narcotic legislation extant" By vigilant federal and provincial police administration and pro cen-tions 662 persons, of whom 519 were Chinese, have in the past seven years been deported from Canada after convic tion for selling or possessing narcotics illegally The Pacific coast and the boundary line with the United States are patrolled, the mounted police having rendered valuable aid, by astute detective measures some of the "big connexion" of the international gang of smuggler have been caught, fined, and committed to several years in a penitentiary, while the lash has been legalized as a penalty for pedlars in narcotics Such articles as these should serve to dispel the notion, still prevalent in some quarters, that the drug addict should be merely an object of compassion, and that any attempt to deprive him of his opium or other drug by legislative enactment is unwarrantable, even if not futile Police evidence testifies abundantly to the fact that such drugs as heroin and cocaine not only conduce to moral degeneracy and criminal acts, but that they are resorted to by criminals, both male and female, such as the gangsters of Chicago, to nerve them to the commission of crimes of desperate violence

SCHEDULED INDUSTRIAL DISEASES IN GERMANY

DR TELEKY, the medical inspector of factories stationed in Düsseldorf, with a large industrial area under his supervision, deals in a recent article[1] with the twenty-two occupational maladies which have been brought under the Accident and Invalidity Insurance Law Compensation becomes payable only after twenty-six weeks under the Sickness Insurance Law is exceeded Although drawn up on our English model (many of the maladies and forms of poisoning being the same), the interesting thing about the German list is that at least seven maladies do not appear in our list at all, while others, such as nystagmus, which one would expect to see scheduled, are not Thus, the diseases which do not appear in our list, or are scheduled under stricter limitation, are chronic and re-current skin diseases from galvanizing processes, chronic and recurrent skin diseases from some foreign woods, chronic and recurrent skin diseases from soot, paraffin, tar, anthracene, pitch, and allied substances, diseases of the muscles, bones, and joints from the use of pneumatic drills, diseases of the deeper air passages and lungs from basic slag, severe diseases of the lung due to dust (silicosis), or tuberculosis accompanying silicosis, Schneeberg lung disease, and deafness or hard-hearing bordering on deafness caused by noise The Schneeberg lung cancer is confined to a small district in Germany, nothing like it is found in this country Basic slag is not largely produced in this country, because the kind of phosphoric ores found in Germany are much more amenable to the Thomas Gilchrist process The scheduling of deafness due to noise is interesting, as this trying defect is a notable instance of the fact that in our own country compensation is given for incapacity and not merely for being the victim of a specific malady contracted from employment A flood of literature in the German medical press is discussing now, "When is a skin malady to be described as chronic?" and "When is silicosis to be described as 'severe'?" the general conclusion being that the code must shortly undergo revision

The Thomas Vicary Lecture, on "Vicary's predecessors," will be delivered by Professor G E Gask on Thursday, November 6th, at 5 p m, at the Royal College of Surgeons of England, Lincoln's Inn Fields

MEDICINE AS A CAREER.*

BY

SIR HUMPHRY ROLLESTON, BART., G.C.V.O., K.C.B., M.D.

REGIUS PROFESSOR OF PHYSIC IN THE UNIVERSITY OF CAMBRIDGE

THERE has been much argument whether Medicine should be regarded as a science or as an art in which science is applied, and it may be questioned if a really comprehensive definition of Medicine has yet been framed. This shows, what no one can seriously doubt, that it is a many sided profession, presenting a varied choice of possible fields of activity before those who have to decide whether or not it is likely to provide them with a satisfying life career. It offers attractions to men of very different minds—to the humanitarian, 'practical,' educational, and scientific. The proper study of mankind is man," and this includes his psychopathology as well as his physical disorders, medicine touches human life at many points, and exerts its influence on the State, law, industries, education, it appeals to the naturalist and to those who feel impelled, in William Harvey's words, 'to search and study out the secrets of nature by way of experiment."

An interest in disease and all that it means draws men, according to their habit of mind, in one of three directions (1) to practise medicine, curative and preventive, (2) to investigate the problems of disease, or (3) to teach others. The second and third of these occupations are not uncommonly combined, and, though undoubtedly most important, are not adopted by more than a very few of those who take up medicine as a profession. It may perhaps be convenient to speak of research and teaching as careers in medicine before considering the more extensive subject of the various forms of practice.

CAREERS IN MEDICAL RESEARCH AND TEACHING

Research for the advance of medical knowledge is of two kinds: (1) clinical observation, controlled by post-mortem evidence and aided by the numerical or statistical method, as in the past gave most brilliant results in the hands of Hippocrates, Sydenham, Skoda, Bright, Addison, Louis, Stokes, Osler, and others, it is the more difficult of the two, and, though it should most certainly continue has been helped by and has often utilized, the methods and apparatus of the laboratory which are essential parts of (2) the experimental method of physiology and pathology begun by Galen, revived by William Harvey, and which now, widely established and organized, has expanded through experimental medicine into 'clinical science." This is the phrase used by Thomas Lewis, who has drawn a sharp distinction between the training, necessary attributes, career, and ideals of (*a*) those who devote their whole-time energies and life to clinical research, and of (*b*) clinical workers who in the past were largely responsible for the progress of medicine. The research physicians of the new clinical science should work not in laboratories, but in hospital wards, unlike the ordinary physician, their main objective should be, not the diagnosis of a known disease, but the investigation by experimental means of the unknown processes at work. Their mental attitude, Lewis says, should be one of diffidence and scepticism, in contrast to the necessary self-confidence and optimism of the successful consulting physician. Further, the career of the clinical researcher should be life-long and not an episode to fill in time before he becomes a hospital physician with an eye to consulting practice. In fact, Lewis states that such transient research is seldom of any scientific value, and unfortunately has acquired a recognized commercial value, which indeed may be the chief goal in view. This is a hard saying, and, as regards the value of the work, a generalization not entirely borne out by past experience, while admittedly the consultant's outlook is broadened and his capacity for teaching improved by early apprenticeship in research.

The creation of whole-time professors as directors of clinical units in some of the medical schools in London, with assistants who may be whole- or part-time, might supply the men and the posts for clinical science, but the heavy duty of teaching general medicine now undertaken by the units has necessarily restricted clinical research or the special character indicated. Whole-time workers with a minimal amount of teaching might be attached to the units and enabled to live and work by grants from the funds of bodies such as the Medical Research Council, the Beit Memorial Fellowships for Medical Research, and the Rockefeller Foundation's Medical Fellowships. So far there are few applicants for this new career in clinical science, this may be partly because established and permanent openings have been very few in the past. How many men are really fitted for this high calling remains to be seen, but that provision will be forthcoming in the not distant future for the right men seems certain from the recent report of the Medical Research Council. In addition to possessing the necessarily high ability and elaborate training men who decide to devote their lives to clinical science must be prepared for laborious days have little ambition for a prominent position in the limelight, and none for great financial rewards. They must be inspired with the keen desire of discovering hidden truth, and prefer the prospect of perhaps completely solving a few problems after prolonged labour to that of constantly attempting this daily in many cases and without much probability of any certain success.

Those engaged in clinical science will it may be hoped prevent the divorce and bridge the gulf between animal experiments and laboratory work on the one side, and clinical observation on the other. Trotter shows that clinical observation is fruitful in initiating ideas, and the experimental method in putting them to the proof, and that experimental investigation on man, limited as it obviously must be in its extent, is the only wholly unexceptionable method available for the solution of problems of human health and disease.

Lines of research in connexion with medicine are well established in pathology, bacteriology, pharmacology, and biochemistry, the workers in these sciences have from the nature of the available posts, usually been professors, lecturers, or demonstrators, and so primarily teachers. But such teachers should have time for investigation, as thereby they become more inspiring to their pupils. To be good, teaching should be a labour of love and the gratification of the desire to do so, not a means of livelihood only. A teacher's first aim should be to understand his pupils rather than to keep them in order. Successful teachers are of two kinds: those with the talent of presenting the subject systematically to average students so as to secure examination successes—good conductors if not the live wires of the second and higher category, who are of an imaginative, often artistic, nature, stimulators of thought, compellers of enthusiasm, and founders rather than the necessary props of schools.

THE PRACTICE OF MEDICINE

Medicine in the ordinary sense—namely, the supervision and cure or the sick—is not, and probably never will be, an exact science. It is an art aided by the application of several sciences, in which philosophy, religion, and sometimes commercialism also play some part. The degree in which science is applied varies, not only in the hands of different individuals, but in the various branches or departments of medicine, the special branches in which science can be most extensively applied, as in ophthalmology, are for this reason the most satisfactory to those with a scientific turn of mind.

As already mentioned, the essential attributes of a research physician differ in some respects from those necessary in the practice of medicine. Success in the healing art, unlike success in pure science, does not depend solely on mental ability; it demands the properties of the heart as well as those of the brain, and perhaps this cannot be better expressed than in the words of the familiar text "Though I have the gift or prophecy [prognosis] and understand all mysteries [diagnosis], and all knowledge, and though I have all faith, so that I could remove mountains [confidence and operative skill], and have not charity, I am nothing" (1 Corinthians, xiii, 2). To the

* A lecture given at King's College, University of London, on October 15th, 1930.

abilities of an engineer and chemical expert of the human body a doctor should add love of his fellow men and some other qualities of a broad-minded churchman Sympathy requires imagination to see into the minds and understand the anxieties and needs of those who come to be helped and cured, sympathy should not be blunted into callousness by contact with the naked and often repulsive features of poor human nature Unselfishness, common sense, cheerfulness, reasonable optimism, kindly tact, a good memory, punctuality, and methodical habits, are among the traits and manners that make the real doctor To be prepared for whatever emergencies may occur in practice demands imagination and foresight, and, though the whims of chance influence the future in ways that to some onlookers may seem very unfair, probably many of those regarded as lucky are so because they are able to turn opportunities as they arise into solid advantages Good health is obviously important to withstand the strain of continuous hard work, and in their own interest doctors should set an example of personal hygiene, temperance, proper recreation, exercise, and holidays, in spite of the manifold difficulties of their circumstances

Although it is less than sixty years since the London School of Medicine for Women was opened in 1874, the existence, need for, and spheres of usefulness of women doctors are firmly established In this relatively short time women doctors have every reason to be proud of the progress they have made in spite of some conservative prejudice

Choice of One of the Branches of Medicine

Heredity in the form of a paternal general practice may from an early date decide the future medical man's life's work, just as happens in business, and general practice is then the obvious course in the absence of any strong inclination in other directions, such as research for its own sake, ambition, a love of travel, or desire to enter the fighting services But otherwise the choice is far from easy, and indeed it is inadvisable for the student to feel that he should at once and finally settle what particular line of medical work will eventually prove most satisfactory and suitable For not only do the individual's tastes and capabilities change as his development becomes more mature, but the branches and opportunities of medical practice tend to become more numerous, to alter and expand, with the passage of years The necessary data for a wise decision may not be available until some time after qualification, when circumstances, or what seems to be almost an accident, may show what is a man's real bent There is much wisdom in the advice, "Do not specialize too early," for the essential basis of real success is a good general knowledge of medicine as a whole

While one, and certainly the commonest, reason for entering a profession is to obtain a livelihood in a reputable manner, this objective can be reached more easily, rapidly, and in greater measure in some form of trade than in medicine On the other hand, medicine meets a universal demand, and with the expansion and development of medicine and of appointments under the State at home and abroad there are more opportunities and various openings now than ever before Secondly, apart from illness, accident, or misconduct, every competent qualified man or woman can be fairly certain of gaining a living wage, thus contrasting favourably with other professions, though the great prizes are few as compared with those in Law and the Church To enter on the "physic line" may be justified as a means of keeping the wolf from the door, but it cannot be recommended as a way to get rich quick, or indeed to get rich at all It has been estimated that before the war the average income of the medical profession was about £500 a year, and now is about £750, both gross, so that with the present high cost of living and taxes the position is about the same This, of course, leaves little margin to save and provide for the time when illness or old age arrests activities An advantage of public practice—namely, practice for the State, as in the fighting services—is the assured pay and a pension

The life of a medical man, especially in general practice, though full of human interest, is hard, qualification is only a milestone, though an impressive one, in what should be a lifelong studentship Much exposed to infection, hard worked and usually poorly paid, subject to numerous anxieties and the occasional danger of vexatious legal actions for malpraxis, the average span of life among medical men does not equal that of the Church and the legal profession The statistics got out in three London schools at various times by Sir James Paget (1869), Sir Squire Sprigge (1906), and Mr E M Corner (1920) show that the outlook for medical students is encouraging, for about 75 per cent become qualified, and, according to the first two authorities, 66 per cent of those qualified should be satisfied with their professional success Although it has been said, and, of course, with truth, that "it is not the degree that makes the man," there can be little doubt that, other things being equal, a university degree (particularly the letters M D), quite apart from the training are a very considerable asset from the popular and material point of view The schoolboy looking forward to medicine should realize this at a stage when he can make arrangements to matriculate at a university, and so avoid regret later that he had not taken the opportunity at the proper time for it is difficult and time-consuming to remedy this at a later stage in the medical course

General Practice

In spite of various developments, especially the establishment of State medical services, of the clinics for tuberculosis, venereal disease, dental care, school children, child and ante-natal welfare, of the large amount of midwifery done by trained nurses, and of the competition of the increasing number of specialists, general practice still claims the vast majority of the medical profession The increasing activity of the State and municipal bodies in the care of the common health has created some anxiety about the future of general practice, and raised the question of the introduction of a universal State medical service, comparable, for example, to the organization of the postal service Indeed, from what has already taken place further advance in this direction is extremely probable, if not inevitable, it would appear that this impression is now becoming more general, thus the Council of the *British* Medical Association has proposed a scheme of general medical service for the nation which will provide every kind of treatment, and be based on a contributory insurance system, and on the fundamental principle that every individual is under the care of a general practitioner There is not any reason to fear that the medical profession would suffer financially under some scheme framed on these, or indeed other, lines, the work must be done by them, and they would have as now in the case of panel practice, an assured income From uncertainty about the future young medical men are said to be reluctant to purchase practices, especially in the country There is, however, little justification for pessimistic views about the future of general practitioners Under any anticipated change in their present independent position they would still be in the best possible position to detect and correct the earliest stages of ill-health, when prevention—the ideal of modern medicine—is most easily effected They are thus the first line of defence against disease Their disappearance, if indeed it were possible, would be a calamity

The conditions of general practice have greatly altered, in many ways for the better, improved medical education and equipment have brought about a corresponding change in medical practitioners, who can therefore take their share in an organized national scheme for the prevention of disease and an improved national health The scheme of medical benefit under the National Health Insurance Act, 1911, has improved the financial position of panel practitioners as compared with the conditions under the old "club system," and the forebodings and opposition which the panel system evoked from the profession at the time of its introduction are now happily forgotten

The number of registered medical *men* resident in England at the end of 1929 is estimated at 33,443, and the number of panel practitioners 14,726, or 44 per cent , for *women* the corresponding figures are 2,320 and 776, or 33 per cent In 1925 the estimated number of registered medical *men* in England was 27,600 and of these 12,696, or 46 per cent , were on the panel showing that there has now been a considerable increase in the total number and a slight fall in the percentage of those on the panel the

change in the position of women is almost in the opposite direction for in 1925 there were 2,209 registered medical women of whom 434 or 19 per cent were on the panel The number of medical women on the panel has thus markedly increased though the total number on the *Register* has risen very slightly These figures kindly supplied by Dr J Smith Whitaker of the Ministry of Health are chiefly noticeable for the increasing degree that women by taking more part in the rough and tumble of panel practice are establishing closer touch with the lives of the poor

A man in general practice must possess some knowledge of every branch of medicine in fact he must be an all round specialist in miniature, with the important proviso that he realizes his own limitations—what he can do himself and what in the patient's and indeed his own interests he should leave to consultants and specialists With the approaching a real all round specialist is, of course impossible, but to some extent the difficulty of covering the ground in general practice is met by firms of general practitioners so constituted that each of the partners is more skilled in medicine, surgery, or midwifery, and in one or more of the specialties This team work is on the lines of the divisions of a hospital staff

There are other lines of work compatible with, and closely allied to, general practice Examination of people for life assurance is part, but not a considerable item of a general practitioner's routine Some men however, act for several companies or as the chief medical officers of these companies occupy a considerable part of their time in this way but the chief advisory appointments are usually held by consultants and hospital physicians Periodic health examinations of the supposedly fit analogous to periodic visits to the dentist, are an obvious measure of preventive medicine, American life assurance companies have made 100 per cent upon the money spent in providing their policy holders and employees with these medical inspections, for thus incipient disease is detected and unfavourable influences in the individual's habits or environment can be corrected If periodic overhauls of children every six months and of adults annually became general in this country, a line of medical work, allied to that of life assurance, would be opened up this would most suitably be entrusted to the family doctor because he is acquainted with the environment, traits and conditions of the individuals concerned Medical appointments to look after the staff of big business firms and police surgeoncies, are nearly always part-time occupations, and best held by general practitioners Industrial medicine should become more widely organized and provide more posts for medical men, some of which will probably be whole time

CONSULTING PRACTICE

For future consulting physicians the highest university degrees and for consulting surgeons the Fellowship of the Royal College of Surgeons are practically essential, for without them it is difficult or impossible to become physicians or surgeons to most large hospitals—a position necessary not only to maintain efficiency, but to inspire the confidence of practitioners After qualification the embryo consultant should hold a resident appointment as house-physician or house-surgeon at a hospital with a teaching school, here he is in a position of responsibility is the immatur of the visiting physician or surgeon, and like him, teaches the clinical clerks and dressers, and while gaining this experience thereby extends his own knowledge At this time he should begin to collect material for a thesis or other paper After holding this most important office he should proceed if he has not already done so, to a higher degree or diploma, and then seize the opportunity, which will never again be so easy, of enlarging his horizon of medical science thought, and men by spending some months in clinics on the Continent or in America, learning (or perfecting his knowledge of) French, German, and Italian and watching the various methods of research, teaching and practice This, of course, is made more easy by the fortunate possession of a travelling fellowship, or monetary grant which enables him to make a longer visit than might otherwise be possible and to undertake a piece of research work—for example, the solution of a problem which came before him during residence as a house-physician or house-surgeon

After this he should return to obtain a hospital post, such as registrar or member of a professorial unit which, while supporting him financially, is a rung on the ladder towards the permanent staff of the hospital, and provides clinical work further experience in teaching, and opportunities for independent research and reading This is the seed time when he can consolidate "the student habit," store his mind with ideas, and lay the foundation of a reputation as an authority The future consultant has not only to labour but to wait, and this time of probation tests and often sorely tries his grit, but on its proper utilization the future depends, for the weeding out of the competitors now becomes more acute and critical, and time, born of satisfaction at getting so far in the point-to-point race, may easily lead to a fall With the experience thus accumulating he should, after a time, be in a position to publish papers, not because "he has something to say" but because "he has something to say" the main advantage of this is not advertisement which indeed is usually disappointing and may even be harmful, but because, like teaching only more so it is a valuable discipline on account of the work thought, and reading necessary to deal thoroughly with the subject

In the past the lean years of the waiting period were so difficult financially that it was often said that only men with private means could hang on, especially as physicians, with a view to consulting practice There were, however, many exceptions then, and now, when the posts, such as registrarships at teaching hospitals, open to men at this stage, are far more numerous and better paid, and there are far more scholarships and grants for original investigation, this difficulty is not so serious But on the other hand, the possession of a comfortable income is far from an unmixed advantage, for it removes the poor man's obligation to scorn delights and live laborious days, no doubt the danger that he may do little or nothing meanwhile possesses or of independent means can wait, but there is It has been said, with some degree of truth that a consultant is made, not born, and there is no doubt that he has a hard task in making himself efficient and successful

The highest positions in the profession are gained by a few or largest incomes in the profession are gained by a few or the General consultants who, however as a whole have had their wings somewhat clipped by the legitimate growth of specialism, and as mentioned elsewhere many physicians and surgeons tend to concentrate more or less though not entirely, on some division of their extensive subject General physicians have suffered more than their surgical brethren, partly from the increased number of special hospitals, and partly from the much better equipment of general practitioners without an independent income the long wait may be tragic, and many deserving men never get their reward

Consulting surgeons "arrive" earlier, so that their waiting period is less trying than that of their medical colleague Their operative skill has enlarged their regional activity at the expense of the physician's territory, and their financial rewards are much greater The cures wrought by operation are much more obvious and spectacular than those obtained by the physician, who must often admit time as his partner in procuring a successful issue It is not surprising that surgery has lately been more attractive than internal medicine On the other hand, an operating surgeon's tide of activity ebbs earlier, and the physical strain of his exacting life is greater than in the case of the physician It is difficult to foretell the future accurately, but the pendulum may swing back and the surgeon's province and harvest shrink The surgical specialties—orthopaedics, genito-urinary and venereal disease, laryngology and otology, and proctology—have already encroached considerably on his domain and there is accumulating evidence that radium may diminish the need for surgical treatment of malignant disease in some of its most frequent sites It immunology should succeed in banishing infective disease—especially in the abdomen, so that inflammation of the appendix and gall-bladder and peptic ulcer become rare—and if the cause and means of preventing malignant disease were discovered, the conditions demanding the use of the knife would become comparatively infrequent.

CAREERS AS SPECIALISTS

The term "specialist," though often applied by the public to consulting physicians and surgeons in order to distinguish them from general practitioners, properly belongs to those who confine their practice to special departments, such as ophthalmology, gynaecology, laryngology, otology, psychiatry, orthopaedics, and radiology. The enormous advances in all branches of medicine, and the skilled technique required, have made specialization most necessary and beneficial, and the conservative disapproval of specialism by the leaders of the profession in the last century is now of interest only as a phase in the history of the healing art. Most of the specialties mentioned above demand skilled technique, but in addition the ever-increasing detail of medicine is splitting practice into a mosaic, so that there is an inevitable tendency for individual consultants to pay particular attention to some one part of the body or group of diseases, such as the heart, nervous system, lungs, the skin, the genito-urinary tract, the rectum, tropical diseases, or even rheumatism and gout. Intensive study, of course, leads to the advance of knowledge, the perfection of technique obtained from constant practice, and the benefit of patients.

Specialism should be superimposed on a wide acquaintance with medicine as a whole so that in order to avoid a narrow outlook a specialist should know something about every division of the healing art as well as everything about his own subject. It is therefore a mistake to specialize too early: it cannot be begun until after qualification, and should not be attempted until after a resident appointment—house-physician, house-surgeon, or preferably both—at a general hospital, a resident appointment at a hospital for the special diseases in which he is interested should then follow. In many instances there are special diplomas to be obtained, and preparation for these examinations should now engage the future specialist's attention. In addition, the possession of university degrees or the Fellowship of the Royal College of Surgeons is most desirable.

From the material point of view specialists have the advantage, as compared with general consultants, and especially physicians, that the waiting period is shorter, that financial success comes sooner, and may be considerable, though seldom so phenomenal as that occasionally secured by a few outstanding general surgeons and physicians. In America specialization is advancing with somewhat excessive rapidity; in his recent attractive *Doctors and Specialists*, Dr. Morris Fishbein mentions that, whereas in 1905 about 10 per cent. of those whose names appeared in the *American Medical Directory* were specialists, now 25 per cent. of the 150,000 medical practitioners limit their work in this way, and that a questionary addressed to the graduates of Class A medical colleges showed that more than 50 per cent. had already chosen their specialty before obtaining resident appointments.

CAREERS IN THE SERVICES

The call of adventure and the desire to see the world attract men to the medical services of the Royal Navy, Army, Air Force, or of the Colonial Office, and provide a life with varied interests including sport, an assured rate of pay, a pension on retirement, and so freedom from the worry, waiting and the carking cares that may attend private practice. The commencing rate of pay in the Royal Navy is about £413, in the Royal Army Medical Corps £511, in the Indian Medical Service £586, the Royal Air Force £556, and the Colonial Medical Service £600 per annum, and, of course, the pay rises with the rank and length of service.

The opportunities for original work have increased in the fighting services, and that devotion to scientific research is compatible with gaining the highest posts was shown by the late Sir William Leishman's appointment as Director-General of the Army Medical Services. Tropical medicine, with its wide potentialities, is specially open to those in the Colonial Service. Since the war, however, there has been a shortage of medical officers in the fighting services, and accordingly short commissions of four years or so have been offered, they carrying with them a gratuity on retiring, which helps considerably in starting practice. The exigencies of the fighting services may station men where there is little medical work to occupy their time, and where they are isolated from medical colleagues and facilities, there is then a danger that unless they are really keen and resourceful they will get rusty and out of touch with their profession, much obviously depends on individuality and independence of mind.

The progressive activity of the State medical services provides many official positions, not only part time, which are chiefly occupied by general practitioners, but whole time appointments. Medical officers of health are similarly either part-time and then general practitioners, or whole time officials in the larger towns and districts. The resident posts in fever and mental hospitals are also whole-time, and are graded with progressively increasing salaries and pensions. From a material point of view it is thus obvious that these appointments in the various services have the advantage over private practice that a pension is assured on retirement. It must, however, be admitted that retirement, especially in the fighting service, sometimes comes early, before capability of good work is exhausted, but rather late to strike out in a new line, such as a consultant in tropical diseases, or in general practice.

SUPPURATIVE DISEASES OF THE LUNGS

LECTURE BY DR. CHEVALIER JACKSON

AT a special meeting of Fellows of the Royal Society of Medicine on October 14th, Dr. CHEVALIER JACKSON of Philadelphia delivered a lecture on suppurative diseases of the lungs. Dr. T. WATTS EDEN, president of the Society, was in the chair, and the attendance was very large, many standing all round the Barnes Hall for the two hours which the lecture and the subsequent proceedings occupied. Dr. Chevalier Jackson showed himself to be a lecturer of consummate skill. His lecture was illustrated throughout by lantern slides (chiefly radiographs of chest conditions), except for drawings on the blackboard, which he executed with coloured chalks and with an artistic genius which evoked much admiration from the audience. At the close of the lecture a cinematograph film, which had been prepared by Dr. Jackson's son, was projected, illustrating schematically the different kinds of check valve action of the respiratory tract, and also the method employed in Dr. Jackson's clinic for the treatment of pulmonary suppurative conditions by bronchoscopic aspiration.

Dr. Chevalier Jackson began by pointing out that suppurative diseases of the lung formed so vast a subject that any presentation of it must necessarily be limited. He could only show and describe a few of his clinical cases, with his own interpretations thereon, which might be wrong. In discussing first of all the etiology of the condition, he said that inefficiency of the cough reflex was one of the most important etiological factors. He doubted whether this was appreciated clinically as fully as it should be. Sometimes the cough reflex was totally absent, at others present but inefficient. He feared that at times the cough reflex was destroyed by the giving of opium derivatives and atropine, which so thickened the secretion as to render expulsion more difficult. The primary factor from the bronchoscopist's point of view in all suppurative diseases of the lung was bronchial obstruction. So long as there was free ventilation and drainage, the defensive powers of the lung could cope with almost any infection which found its way in by the air route; he was not at the moment talking of infections which came through the lymph or blood channels.

TYPES OF BRONCHIAL OBSTRUCTION

There were many kinds of bronchial obstruction, but those which were mostly seen by the bronchoscopist could be divided into three. One of these was the complete

stoppage or blocking up of the bronchus and the others were two different kinds of valvular stenosis He likened the three kinds of obstruction to the action of valves in hydraulics—the by pass valve the check valve and the stop valve In the first of these the lumen of the airway was diminished but air could still pass in both directions In the second the air could flow only in one direction owing to the fact that the walls of the bronchus were compressed by the obstruction until the air could not escape, though when the patient took a very deep breath he could draw air past the obstruction, the lumen closing *again at the beginning of inspiration* The third or stop valve represented a complete obstruction, the air being able neither to get in nor out

Dr Jackson likened himself several times in the course of his address to a plumber, saying that treatment by bronchoscopic aspiration was in reality no more than a plumber's job and he described at length the check valve action which permitted the flow in only one direction, and which was found in the action of most pump and was indispensable indeed in the case of reciprocal pumps If there was a valvular mechanism causing a flow in only one direction, this would either fill or empty the reservoir according to the way the pump was set and thus one had either obstructive atelectasis or obstructive emphysema The check valve action of the bronchus was due to the clogging of the cilia by the suppurative material, rendering the cough reflex less efficient when the patient expectorated It was often extremely difficult to remove this material by bronchoscopic methods In the ordinary process of coughing, the pus was coated with saliva, which would coerce this thick material with it, but on aspirating the thick material through a tube sent down into the pus focus it required 5 or 10 lb negative pressure to pull it out The task was so difficult because the cilia were clogged up with this tenacious secretion, and the air could not get below to expel it He also instanced cases of obstruction by another kind of secretion Asthmatic patients—that is to say, cases of true asthma, for 80 per cent of the patients referred to the bronchoscopic clinic for asthma had not got it, but had some other kind of obstruction—had also a thick secretion, having something like a jelly appearance, but in reality extremely tough A good deal of the air hunger of the asthmatic patient was due to this secretion pumping air out or his lungs—not only preventing the air from getting in, but acting like a valve in pumping it out

After pointing out that bronchoscopy might be a useful preliminary to lipiodol injection, Dr Chevalier Jackson went on to speak of obstructive emphysema, due to the presence of a foreign body He showed one case in which the x-ray appearance made it plain that there was a valvular obstruction whereby air could not escape from one lung, though it could do so from the other, and so there was abnormal distension on one side The patient in question was a child brought from a Western clinic by his father, who was himself an internist, and who knew that there was air in the lung and plenty of it, but was unable to hear any going in or out It was concluded that there was obstructive emphysema, but nothing was known of any foreign body A foreign body—a plum stone—was, however, detected and recovered Some form of obstruction was present in nearly all pulmonary diseases, if not present at the beginning, it developed later as a perpetuating factor Benign growths of the lung could act as check valves

All the three types of bronchial obstruction which he had described were to be found in many different diseases He showed one case of a child with diseased glands In the earlier stages of the case the child had a wheeze That was an example of the first type of bronchial obstruction, a diminution in the lumen of the airway, which, however, was still capable of passing the air in both directions *Later the size of the mass increased and pressed upon the* bronchus, compressing the two walls until the air could not escape When the child took a very deep breath he could draw air past the obstruction Finally, in the case which went on to complete obstruction, the air was able neither to get in nor out, but just before that stage was reached there was usually a reversal of the check valve action, whereby the air was pumped out of the lung which was left empty in other words there was atelectatic collapse In another case a child was supposed to have pneumonia and that also was the opinion of the radiologist from the x-ray examination but when a bronchoscopy was done it was found that a bed of timothy grass had got into the lung, and was causing obstruction This again was a case where the defensive power of the lung was weakened by the obstruction of ventilation and drainage Another of the interesting cases shown by the lecturer was one of congenital atelectasis, here the bronchus had been shut up completely by a membrane There was no suppuration in this case, for infection began when the lung contained air, the air introducing micro-organisms—not many of them if the defensive powers of the lung were normal—but if there was obstruction and the "plumber" was not at hand the defensive powers of the lung were weakened, and suppuration went on rapidly Any foreign body could cause suppuration Any kind of nut kernel or organic substance brought this about relatively quickly, with metallic substances a longer time was taken before suppuration supervened Sooner or later however with any kind of foreign body in the tracheobronchial tree suppuration ensued He recalled one case in which, twenty-two years ago, he had been asked to remove a pin from the lung but the pin could not be located He heard no more of this case until recently, when an external operation was advised for drainage He suggested that if it was a case only of the removal of the pin he felt sure that it could be taken out through the mouth by bronchoscopic aspiration Thereupon he was asked whether he was wiser than he had been twenty-two years before, when this procedure had not been recommended His reply was that he himself was not wiser, but that in the meantime bronchoscopy had made progress In fact by bronchoscopy, that pin was got out within a space of two or three minutes, a thing which would have been impossible under the procedure employed earlier A non irritating metallic foreign body like a pin might remain for an indefinite time and do no harm, but sooner or later the process of suppuration would set up a fibrosis and cause trouble

Work of the Bronchoscopic Clinic

Dr Chevalier Jackson here gave the figures for his bronchoscopic clinic in Philadelphia for two periods five years apart

	Total Cases	Disease	Foreign Body
Four months ending December 31st 1925 ..	435	384	51
Four months ending December 31st 1928 ..	6,938	6,826	112

Five years ago 88 per cent of the cases which came for bronchoscopy were cases of disease, this figure was now 98 per cent Nevertheless the possibility of a foreign body in any suppurative disease of the lung must not be overlooked He proceeded to show a number of cases illustrating the variety of conditions which came to the clinic One patient came in with profuse haemorrhage and on bronchoscopy it was found that a black mass was obstructing the bronchus, it proved on removal to be an anthracotic gland In another patient, who had had pneumonia followed by suppuration, the temperature dropped, the suppuration cleared up, and the post-pneumonic process disappeared as a result of bronchoscopic aspiration One patient required as many as forty-five bronchoscopic aspirations before the condition was cleared

A considerable number of cases consisted of post-tonsillectomic and post-operative pulmonary abscess There was a concealed etiological factor in these cases Cases occurring after tonsillectomy were particularly worthy of study because of the seriousness of the condition compared with the relative slightness of the cause As Dr Dan McKenzie had said, it was very disconcerting that so serious a post-operative complication should ensue from such a relatively minor operation as tonsillectomy Professor Jackson mentioned one patient, treated for post-operative pulmonary abscess, who got well after seventy-five bronchoscopic aspirations The internist was inclined to give up

this treatment, but the patient himself insisted on its continuance, saying that he was feeling progressively better, and in the end, when the internist went over the patient and the radiograms, he was bound to confess that the result was one of those things which were hoped for but never expected

Dr Chevalier Jackson concluded by giving a description, drawing on the blackboard meanwhile, of the mechanism of obstruction, and of the establishment of drainage and ventilation He claimed for bronchoscopic aspiration that, in treatment, it could be used to restore the defensive power of the lung, especially the ciliary action, and in prophylaxis to prevent the stagnation of pus, which was the chief factor in the production of a chronic condition arising out of an acute suppurative process

VOTE OF THANKS

Lord MOYNIHAN, in proposing a vote of thanks said that the lecturer had given an exquisite description of his method and its results If there was one among the great dead whom he would have wished to be present on that occasion it was John Hunter Reynolds's portrait of John Hunter, by the way, included among the objects on the table at Hunter's side a specimen of primary ossification of the lung of which the lecturer of the evening had also spoken, and had shown some very remarkable photomicrographs In graceful allusion to Dr Chevalier Jackson's gifts as an artist, Lord Moynihan said that although his name might be supposed to indicate some link with France, his real affinity must be with Italy, and his skill with the pencil had reminded him of the great Giotto of the Italian Renaissance, who, when Benedict XI required his presence, sent his card to the Pope in the shape of a perfect circle drawn by a free sweep of the brush from the elbow The speaker had rejoiced that evening not only in the disclosure of new knowledge, but in the artistry which had been displayed by Professor Jackson in his rapid and perfect execution of the coloured drawings, which, he believed, were to become the permanent possession of the Society One feature of the lecture which had given him special pleasure was the constant reference Dr Jackson had made to his son and his assistants, for the real immortality of a man was not centred in his own work, but in the diffusion of his ideas and knowledge among multitudes of other men who were imbued with his spirit and practised in his craft, and in their turn handed on their inheritance to others

SIR STCLAIR THOMSON, in seconding the vote of thanks mentioned that Dr Chevalier Jackson had only landed in France from America on the previous day, he had left his wife ill at Havre, and was returning to France on the morrow

The vote of thanks was accorded with long-continued acclamation by the large audience

MOTOR CARS FOR 1931.

THE OLYMPIA SHOW

[FROM OUR MOTORING CORRESPONDENT]

(*Concluded from page 670*)

IN the past two issues the salient features of the Olympia Show, which closes to-day have been briefly dealt with To the information already given one interesting detail prepared by the *Autocar* may be added We find that, whereas two years ago 50 per cent of the cars were fitted with magneto ignition, the percentage has fallen to about 25, while the coil and battery type has advanced to over 67 per cent Although water circulation by pump is still most widely used, the thermo-siphon principle of cooling shows a slight progress The tendency to provide gearboxes with four speeds, despite the greater flexibility of modern engines, is shown by the fact that these are now found on 55 per cent of cars centrally placed change-speed levers are also more popular On 80 per cent of makes petrol tanks are at the rear of the chassis, while as to wheels, the summary confirms the impression resulting from our examination of the cars at the show that wire wheels are the most popular Our contemporary does not refer to the fact that four-wheel brakes are now universally adopted in many cases (and certainly on all the larger vehicles) these are now equipped with servo-operating mechanism

More British Cars

Continuing our brief review of the principal British cars on the market, Crossley Motors, Ltd, have a novel yet practical car for certain classes of users in a 23-h.p six-cylinder saloon with six road wheels Chief interest, however, centres in the new Silver Crossley 15·7-h.p six-cylinder vehicle, a well-designed and built car with bodywork of an equally high order With an excellent record for reliability, the Star cars are now being made in two sizes, 17·9-h.p and 20·9-h.p six-cylinder The latest models are notable not only for their smart appearance, but for the very complete equipment, which includes a four-wheel hydraulic jacking system, centralized lubrication, and a fog light Of the two Talbot cars available, probably the 14/45-h.p six-cylinder will appeal mostly to doctors As a four-door saloon it is a roomy vehicle, with chassis details that may be relied on to give good service

Medium-power Cars

Those medical men who have a partiality for the Standard cars will find that the makers have an attractive selection for the coming season The "Nine" four-cylinder model has become a "Big Nine" with many detail improvements, and is now available with either a three or four speed gearbox at prices ranging from £195 upward The chief item of the Standard Company's new models is, however, the "Ensign" light six-cylinder car, taxable at £16, and, like the "Big Nine," supplied with either three or four speeds In view of its up-to-date features and attractive prices it is a model that bids fair to become very popular Finally, for those requiring a car with a more powerful engine, the "Envoy Six" of 20-h.p has many points of interest The 7-h.p *Jowett continues* to be the only car with a two-cylinder horizontal engine It has, however, an excellent reputation for reliability Despite its unorthodox features the 10-h.p *Trojan has* proved to be a dependable car, it still remains the only vehicle equipped with an engine which works on the two-cycle principle, and it has the engine and transmission mounted at the rear of the chassis In saloon form the Trojan can seat five persons *The Swift Company*, in addition to the new 8-h.p "Cadet" referred to last week, is continuing the 10-h.p four-cylinder models with many detail improvements

Wolseley and Riley Cars

The Wolseley Company has a very complete range of cars for 1931, extending from the little six-cylinder "Hornet," mentioned last week, to a 21/60-h.p "straight eight" Probably the model of chief interest to doctors is the "Viper" 15·7-h.p six-cylinder, which, as a fabric saloon, is offered at £285, or with coach-built bodywork at £299 The car is one of the most attractive in its class, and embodies all modern details, including safety glass windows and screen and lockheed hydraulic brakes on all four wheels With regard to the Riley models both the four-cylinder "Nine" and the 15·5-h.p six-cylinder vehicles—which have been very popular during the last year—are being continued with somewhat [illegible] under Weymann bodywork than hitherto

An Interesting New [illegible]

One of the surprises of the s[illegible] is the entry of the Vauxhall Company into the fi[illegible] could now is the entry of the cylinder cars *Hitherto* associ[illegible]ay in [illegible] of popular priced six powered vehicles, the comp[illegible] talking of[illegible]ted with relatively high a six-cylinder model know[illegible]lood chann[illegible]r shows for the first time saloon is offered at £28[illegible] the "Cadet," which a and safety glass wan[illegible]kinds of bronch[illegible], or at £298 with sliding roof of the car throughou[illegible]ds The detail ally it is receiving [illegible]y seen by the screen and window are on attractive lines and natur which is rated at 1[illegible] One of th[illegible] considerable attention The engine, other details of the c[illegible] 1 hp 1 of clean design, while th[illegible] has comprises a three-speed gearbox,

servo-operated brakes on all four wheels and hydraulic shock absorbers. The saloon body is of the coach-built type with leather upholstery and comfortable accommodation for five persons. Altogether the new "Cadet" is one that makes a strong appeal and one that is likely to achieve considerable popularity.

American and Canadian Cars

Among the American and Canadian exhibits the Buicks take a prominent place. Hitherto fitted with six-cylinder engines, these now appear with 'straight-eight' power units of respectively 26·4-h.p. and 30-h.p. Overhead valves are retained while a new type of 'synchromesh' silent three-speed gearbox has been adopted. The cheapest Buick is listed at £398 as a very completely equipped saloon. The Chrysler Company is catering for all classes of users, the models ranging from the Plymouth four-cylinder car at £226 to the 40/125-h.p. 'straight-eight' Chrysler at £1,260. Perhaps the most popular of the series is the 20/60-h.p. Light Six," which sells at £299. Another popular car is the Essex which has not only been further improved, but is now being offered at considerably lower prices, with five-seated saloons ranging from £225. The same manufacturers show the Hudson eight-cylinder car, very popular in the United States and likely to become so in this country, in view of the fact that it is now available at £390.

Popular French and Italian Cars

Among the cars popular with medical men is the Citroën, of which there are two models, 12·8-h.p. four-cylinder and 19·3-h.p. six-cylinder, both of which have been improved in detail, notably as regards the brakes, which are now of the servo-operated variety. While thoroughly up to date in design and construction one of the most noteworthy features of the Citroën vehicles is the attractive prices at which they are now available. De luxe models on both chassis are also being produced at higher but equally reduced prices, the additional equipment including a sunshine roof, furniture hide upholstery, safety glass windows and screen, etc. A French car that has been on the British market for many years is the Peugeot. Only two types of chassis are being built—10-h.p. four-cylinder and 16-h.p. six-cylinder—both of which are offered at relatively low prices. A feature of these cars is the provision of lugs below the axle under which jacks can be conveniently and securely placed. The Renault Company, another old French concern, is building cars with four-, six- and eight-cylinder engines, all attractively priced. Fiat cars, which are now being mainly produced in this country, have been improved in detail and lowered in price. Three models are being made of which the more interesting from the medical man's point of view are the 10/30-h.p. four-cylinder and the 18/55-h.p. six-cylinder models.

Notable Motor Bodywork

The annexe to the main hall is, as usual, devoted to a display of cars fitted with special bodywork by carriage builders. Medical motorists who do not mind the slight extra cost can exercise their choice of any particular design of bodywork. There are too many attractive vehicles in this section of the show to refer to them all. Mention may, however, be made of the "Sandwich" coach-built saloon shown on a 16-h.p. Austin chassis by Martin Walter, Ltd. Attention may also be drawn to the examples of high-grade coachwork of Mann, Egerton and Co., Ltd., a firm that has for some years devoted special attention to the motor requirements of doctors.

Prices for 1931

Although a general reference has been already made to the lower prices of 1931 cars, it may be useful to deal a little more closely with the matter of prices, taking £450 as the outside limit for the average medical man, having in mind the standard saloon in all cases. As a choice at under £150 are three of the Baby: the Austin, Morris Minor, and the Singer Junior. For more than fourteen makes are available from £151 including the Wolseley Hornet, the Citroën, Morris Cowley, and Standard. At between £201 and £250 there are fifteen models, nine with four-cylinder and six with six-cylinder engines, among them being the reintroduced Singer 'Ten" and the Morris Major. Six-cylinder cars predominate in the £251–£300 section numbering thirteen as against eight with four-cylinder engines, while in the £301–£350 division there are four "sixes" as against only three "fours". Among the cars ranging in price from £351 to £400 two "straight-eights" compete with an equal number of 'sixes" while at prices varying between £401 and £450 the buyer has a choice of one "four" five 'sixes," and three "eights."

In connexion with prices, it may be added that Messrs. Mann, Egerton and Co., who are mentioned above, cater specially for doctors as well in London as at their four establishments in the Eastern Counties have just issued a very handy *1931 Car Buyers' Guide*. In this the different models available are set out in the order of their list price under the headings of chassis, two-seaters, tabriolet and coach-built saloons, landaulettes and limousines. Thus it is an easy matter for a doctor to pick out from the *Guide* the names of the models he can choose from within the limits of what he is prepared to pay.

The Accessory Section

A rapid walk round the galleries at Olympia shows the wonderful variety of accessories now available for use on motor vehicles. It also proves that although the headlight problem has not yet been completely solved, lamp manufacturers have evolved many devices which alleviate it to a considerable extent, dipping head-lamp arrangements being now quite numerous.

One of the features of the gallery exhibits is the large number of firms catering for the lubricating oil and grease requirements of motorists. The products of all the old-established firms whose names are familiar may be relied upon, but the motoring doctor will do well to stick to the quality and brand recommended by the maker of the particular car used and to remember always that cheap lubricant is false economy.

In view of the popularity of coil and battery ignition the variety of designs available indicates that no effort is being spared in steadily improving the designs to secure reliability of operation. So too, sparking-plug manufacturers are taking their share in the work of improvement. Notable among the latter are the Lodge plugs, the insulator of which are made in accordance with a patented method which ensures maximum electrical insulation combined with the greatest heat conduction.

Winter Motoring Requirements

While many of the accessories to be seen are mainly intended for summer or all-the-year-round use, at this time of the year when frosty and cold weather may be expected to come upon us at any time attention may be drawn to the various aids to winter motoring examples of which will be found on such general display stands as Carriages: these include radiator muffs and also stoves and heaters of various kinds for use in the garage to prevent freezing of the water in radiators and cylinder jackets, and also to facilitate easy starting on cold mornings. Those who prefer to add an anti-freezing medium to the cooling water rather than use a stove will find several are available, prominent among them being the "Zero" glycerin prepared by Price's Patent Candle Company, Ltd., and the 'Stop-it-Freezing" preparation of the County Chemical Company, Ltd.

A Final Word of Warning

It does not seem to be generally known among motorists that the law now requires in all private garages even if the only petrol in the place is that in the tank or spare tin of the cars some protection against fire either in the form of a supply of sand or a portable fire extinguisher. Quite a number of the latter are to be seen at the show, and in order to be on the safe side both as regards the fire risk and offence against the law medical motorists, if they have not already done so, will do well to add a small extinguisher to their garage equipment.

Royal Medical Society of Edinburgh

THE opening meeting of the Royal Medical Society of Edinburgh, which started its 194th session, was held on October 17th, when Emeritus Professor G Lovell Gulland delivered the inaugural address He recalled that he had been president of the society in 1886–87, and spoke of the changes that had occurred during the forty-four years since he had occupied the chair In those days, he said, anatomy and pathology had to be learned as thoroughly as to-day, but bacteriology was in its infancy, and the bacilli of tuberculosis, diphtheria, and enteric fever were all discovered while he was a medical student Organic chemistry was limited to a week's lectures at the end of the session Surgery was confined almost entirely to external lesions, for the abdomen, if not entirely a "closed book," was at all events very seldom opened The invasion of the abdomen by Thomas Keith, who was then extra surgeon to the Infirmary for Ovarian Diseases, was regarded as a rash and almost impious innovation At that time surgeons operated in their ordinary clothes One of the secrets of the success of the Edinburgh school, he thought, was its recognition of the fact that if a man was ambitious he must be a good teacher In other places teaching was a secondary matter, men were coerced into it by their position rather than adopting it as their main work, but in Edinburgh in the past, men began teaching young, and kept at it all their lives The custom that had prevailed in Edinburgh and in the Scottish medical schools generally, of depending largely on systematic lecturing, was a very wise one, in his opinion He had heard the system described as a transcription of a third-rate text-book by a fifth-rate copyist, and of course at its worst it might degenerate into that But at its best—and nowhere was it better than in Edinburgh—it was a powerful means of arousing interest and inspiring enthusiasm In his early days students led much simpler lives, for there were fewer amusements, even bicycling was confined to the few who dared to ride the old high machines There were then no students' union, no public dancing halls, and very little golf, athletics were not organized as they were to-day In consequence students were less distracted from their work, and most of them were dour Scots, determined to make the most of their chances He congratulated present-day students, however, on their opportunities Two things seemed to him very necessary in medical practice one was a proper annual holiday, free from worries about practice, and the second, a month or two of post-graduate study every three or five years He considered that public education in health matters to-day was much behind the times, it would have to be fundamentally remodelled before much advance in medicine could be made

Scottish Radiographic Society

The first meeting of the newly formed Scottish Radiographic Society was held in the radiological department of the Edinburgh Royal Infirmary on October 14th, under the presidency of Dr Chalmers Watson In an address on "The evolution of radiology" Dr W Hope Fowler gave a brief history of the gradual recognition of the importance of radiology in the past thirty years The utility of x rays, he said, in the diagnosis of bone and joint injuries, and in the location of foreign bodies, had been quickly recognized by the surgeon, but the physician had sought help from this source very much later, probably because the only apparatus was very crude, being really a glorified medical coil The best x-ray tubes of the time were easily damaged, and had little power of penetrating the denser parts of the body Improved equipment, however, was soon available, and a gradually increasing number of workers made it apparent that the living body would ultimately be almost as carefully studied as the dissecting-room subject, but progress was slow up to the war Since then, the study of the brain and spinal cord, and of the alimentary canal and gall-bladder, had become common More recently the administration of a drug by the mouth outlined the kidney shadows and enabled the physician or surgeon to make a satisfactory diagnosis Radiology had, in fact, made the exploratory operation almost a thing of the past With regard to radium, all that could be said at present was that it could relieve, and in some instances cure, cases of cancer, but no one was yet in a position to state positively the group of cases that could be definitely cured The best results would be obtained by perfect team work between the radiologist, surgeon, physician, and physicist The work done in Stockholm in this direction had been ideal, that of Paris came next, and then the work of one of the London hospitals While radium had received much attention, deep x-ray therapy, in his opinion, was equally if not more important The highly penetrating x rays had many properties in common with the gamma radiation of radium, and were useful for almost similar purposes In many types of tumour, more especially the deep-seated tumours, the disease could be more effectively dealt with in this way To obtain similar results with radium, huge quantities had to be used in order to enable an effective amount of radiation to reach the deep-seated parts, the only alternative being operative procedure in which small amounts of radium were buried in the affected tissue This had the disadvantage that the opening up of the tissues greatly increased the possibilities of producing a spread of the disease Patients treated by deep x-ray therapy could, in the majority of cases, be treated as out-patients, and the time of treatment was considerably shorter than that required for radium Moreover, the physical and technical side of deep therapy had been much more carefully studied than that of radium, and much more was known about its effects

In expressing thanks for the address Dr Chalmers Watson paid high tribute to the value of Dr Hope Fowler's pioneer work in the Royal Infirmary in promoting this branch of science The radium treatment of cancer was in the forefront of public interest to day, and there was, indeed, a risk that in some quarters it was being studied too intensively, to the exclusion of other forms of radiation. The results obtained in the Madame Curie Hospital organization had been so favourable that some experts had been led to rely wholly on radium in the treatment of cancer of the uterus In cancer about the region of the mouth highly favourable results had also been recorded by many surgeons, the use of radium being here frequently combined with other appropriate surgical treatment In a large group of cases, however, comprising those generally included under the term internal cancer, radium had so far proved of little or no value, and for this group the surgical removal of the growth in its early stages was still the only known remedy It had clearly been established that faulty dosage or technique was apt to aggravate rather than cure the disease An intensive investigation of the subject was now made possible in Scotland by the establishment of four radium centres, working under the National Radium Trust, and the details of the organization set up was a matter of great moment to the community The services of highly trained radium experts were essential in the first place Team work, combining the knowledge of the radiologist with that of the surgeon, physician, and pathologist, had proved the basis of the success so far achieved, a thorough system of records, by which every case treated would be kept under observation for years, was absolutely necessary There was good reason for hoping that the new Scottish Radiographic Society would contribute to the extension of knowledge of radiation as a curative agent

Post Graduate Courses in Glasgow

The syllabus of the Glasgow Post-Graduate Medical Association for 1930–31 is practically on the same lines as in former years Teaching has been arranged in medicine, surgery, and midwifery, and also in the various special branches To general practitioners the weekly demonstrations, which are held on Wednesday afternoons at 4.15, should prove most attractive and instructive There are twenty-six meetings arranged, and the fee for the course is three guineas With regard to the special courses, there is one in ophthalmology, in clinical obstetrics and ante-natal work, in diseases of the ear, nose, and throat, and in radium therapy Many practitioners may

ish to take advantage of the offer of clinical assistantships which are available during the whole winter, and graduates will have the opportunity of becoming attached to wards or to out-patient departments where they will have full scope for studying modern methods of diagnosis and treatment. It is recommended that clinical assistants appointed should devote the whole or a major part of the day to their work in order to get the full benefit and a period of at least three months should be spent at the hospital. Further information and a copy of the syllabus, may be obtained from the secretary of the Glasgow Post-Graduate Medical Association, Dr. James Carslaw, 9 Woodside Terrace, Glasgow, C.3.

Provision for Mental Defectives.

A revised scheme for the construction of Cogarburn Institution for Mental Defectives was considered recently by the Public Health Committee of Edinburgh Town Council on a report by Dr. Guy, medical officer of health for the city, and Mr. E. J. MacRae, city architect. Two contiguous estates, a short distance to the west of the city, extending to 420 acres, were purchased by the Edinburgh District Board of Control for this purpose in 1923, and a start was made with their development before the Board handed over its functions to the town council. The report points out that if the original plan were adopted, the buildings would be very scattered, the nurses' home for example, being about half a mile distant from the hospital. This would involve increased cost in construction and management, compared with other institutions of a similar type—for instance the institution at Coleshill, Birmingham, recently opened under the same Act. Here, accommodation for sixty mental defectives has cost about £8,000, compared with an estimated cost of £13,000 for fifty at Cogarburn. In the Cole hill institution the radial distance from the centre to any portion of the estate barely exceeds a quarter of a mile. It is suggested that the Cogarburn institution should be re-planned in a more compact fashion thereby saving many thousands of pounds through concentration of central heating, diminution in area of roads, etc. According to the present plan the total cost of the building would probably be about £600,000. The more compact scheme, it is thought would not result in any loss of amenity, health or comfort and would add considerably to the efficiency of the institution.

England and Wales

Unoccupied Beds in London Voluntary Hospitals.

King Edward's Hospital Fund for London has been holding an inquiry into the relation between the number of voluntary hospital beds in London and the number which are on the average actually occupied by patients, and has just published a report on the subject. There must, of course, always be some beds unoccupied. There may be some temporarily out of use for cleaning, disinfection, building alterations, or other causes. Again some must be kept ready for accidents or other emergencies as well as for isolation purposes, there must also be an interval between one patient and the next. If it should be found possible to decrease this margin between beds available and beds occupied, the result would be to add to the effective bed accommodation with only a comparatively small addition to maintenance expenditure and no capital cost. The margin differs widely in different hospitals, and the report is designed to assist each institution to ascertain how and why these differences occur and to decide whether the fullest use is already being made of the available beds or whether the margin can be reduced. The report, which deals with the year 1929, shows that taking the hospitals as a whole, the margin was on the average 16 out of every 100 beds, and that this figure may be taken as representative and not abnormal. Out of 15,952 beds an average daily number of 519 were closed owing to building operations, cleaning, repairs, and sundry other causes, leaving about 13 per cent. or the total to be the special subject of the inquiry suggested in the report. For this purpose an analysis is given of the figures for each hospital as compared with other hospital doing similar work and with the average of all such hospitals. A prefatory note discusses the information obtained by the inquiry, and sets out the chief general conclusions that may be drawn from the figures. Copies of the report may be obtained from the offices of the Fund at 7, Walbrook, E.C.4.

Lord Mayor Treloar Cripples Hospital and College.

A remarkably interesting and well-illustrated annual report has been published by the Lord Mayor Treloar Cripples' Hospital and College for the year ending March 31st, 1930. The coming of age of this institution was celebrated in September, 1929, and was followed in October of that year by a festival dinner at the Mansion House, as a result of which over £40,000 was raised towards the rebuilding of the hospital. Until recently the wards used were timber structures remaining from the Princess Louise Military Hospital for troops returning from the Boer war, thus they have been in occupation for about thirty years. It was decided that rebuilding should result in the provision of five ward blocks, each of sixty beds. These wards have been planned with a southern aspect, and open on to a continuous terrace, nearly 1,000 feet long and 25 feet wide, with sloping ways and steps leading to the ground. Each unit of sixty beds contains two wards each of twenty-four beds, two wards each containing four beds, and four cubicles, with a centrally placed room for the sister in charge. At the north side of the wards there is a sanitary spur at each end, with an administrative block in the centre, comprising a surgery, store room, ward kitchen, and nurses' cloakroom. Each of the twenty-four-bed wards will have folding doors securing full access to open air and sunlight. Outside the wards there will be a ten-foot-wide glass-roofed verandah, extending for a length of 136 feet. The first of these new blocks is now ready for occupation, and continuation of the whole scheme is in active progress. All the beds in the hospital at Alton and its Hayling Island seaside branch have been in full use through the year.

In his annual report Sir Henry Gauvain, the medical superintendent, comments on the change that has taken place in the nature of the hospital during the last ten years. Before 1920 hardly any patients were admitted to the hospital unless they were suffering from non-pulmonary tuberculosis. With the great awakening of the public conscience in health matters that followed the great war provision for this class of case began to be made increasingly throughout the country, and it therefore became possible to arrange for all types of crippled children to be treated at Alton. The Portsmouth authorities actively co-operated, and an orthopaedic clinic was established in that city, fifty-five beds being reserved in the hospital for Portsmouth children suffering from any type of crippling. This process has continued, and a similar scheme has now been arranged in connexion with Southampton where a weekly clinic has been opened. The work has extended also to the whole of the county of Hampshire, and weekly clinics conducted by the main hospital have now been established in seven areas; others will be brought into being in the near future. Even so the bulk of the work of the parent hospital is still concerned with the treatment of surgical tuberculosis, the principle of conservatism being faithfully followed, as has always been the case at Alton. To obviate the previously necessary extensive and mutilating operations, ingenious bone-grafting procedures have been designed to immobilize more completely tuberculous joint lesions, but they have so far only achieved a modified success, especially in children. More importance is attached to the application of surgical methods towards the correction of deformity resulting from extensive disease—for example the performance of a bifurcation osteotomy of the femur. *Plastic operations for facial* restoration after lupus vulgaris have also been conducted with remarkable success. Special attention is paid to after-care; discharged patients are seen repeatedly at the London out-patient department or this hospital and in the clinics throughout the county, as well as at Alton. Interesting details are given in connexion with the work of other departments, and an appeal is made for still further financial assistance.

Leeds and West Riding Medico Chirurgical Society

The opening meeting of this session of the Leeds and West Riding Medico-Chirurgical Society was held at the Leeds General Infirmary on October 10th Over one hundred members were present to hear the opening address by the president, Mr J F Dobson, surgeon to the Infirmary, and professor of surgery in the University Mr Dobson recalled that his father had been president of the society before him in years gone by, and was happily present at this meeting in good health Members expressed their pleasure at seeing Dr Dobson senior by their applause, after which the president delivered a delightful address upon the causation and prevention of urinary calculus In this Mr Dobson emphasized the factors which have been proved to play a part in the causation of stone in the kidney, and examined various old-fashioned beliefs by the light of present-day knowledge and experience He noted that stones in the kidney and bladder were much less commonly found among patients occupying the beds of the Leeds General Infirmary than was the case some years before the war He had no doubt that the improved nourishment of the general public had a great deal to do with this freedom from urinary calculus, which had been apparent to several members of the staff of the hospital in recent years After emphasizing the important part that certain urinary colloids must play in keeping inorganic salts in a state of solubility in the urine he put forward an ingenious view that if the profession had at its disposal a means of destroying the organic stroma around which the crystals formed urinary calculus, the stone could be dissolved and surgical removal obviated In other words, the problem of stone in the kidney was capable of being solved if it were only possible to destroy the colloid organic stroma around which crystallization and stone formation started The address was given in almost conversational style, and proved all the more interesting on this account, as it gave the impression of being a gathering of friends and colleagues, rather than a cold formality to hear a presidential opening address After his address, the president gave an interesting demonstration of pathological specimens illustrative of stone in the kidney, and some dozens of lantern slides were shown in an adjacent room before the meeting, illustrating the whole subject of urinary calculus Other members showed cases Dr Veale brought a female patient suffering from recurrent haematemesis, who had been examined by x rays repeatedly, and even by laparotomy, so that members had no doubt as to the diagnosis of gastrostaxis, which Dr Veale advanced for discussion Mr Alfred Gough demonstrated a specimen illustrative of a new operation for uterine prolapse, where the removal of the vaginal walls and cervix formed part of the operative procedure Mr Scargill showed a series of radiograms of a foreign body in the shoulder-joint, for which surgical operation had been advised, and this was finally averted by the disappearance of the foreign body and all the symptoms spontaneously The members were amused when the speaker revealed that the subject of the discussion was himself Mr Chamberlain showed a remarkable collection of spoons and other foreign bodies removed at intervals from the intestinal tract of one man, a prisoner from the local prison, who preferred residence in hospital to the prison regime, and who deliberately swallowed spoons or any other foreign bodies which came handy to his purpose Lastly Dr Ingram demonstrated patients and materials illustrative of the "elastoplast" bandage treatment of chronic ulcers of the legs

Pathological Society of Manchester

At the opening meeting of the session Dr E Bosdin Leech delivered his presidential address on "The pathology of Manchester" His opening remarks dealt with the foundation of the society in 1885, by members of the younger generation, who found the local medical society rather too staid for them and who wanted a society where they could wrangle and argue with each other Since then it had done pioneer work, for Delepine began to diagnose pathological specimens for its members at a small fee The work, however, increased so rapidly that it necessitated the formation of a special department, which later became the Public Health Laboratories As this was the first thing of the sort done, the society could claim to have had a hand in the formation of clinical laboratories, now so important a factor in the diagnosis of disease Dr Leech then discussed the development of pathology in Manchester, from the days when Charles White's museum used to be a sight of the town, giving its relation to the development of pathology in general He described the work of the six men who had held the chair of pathology—Dreschfeld, Delepine, Lorrain Smith, Boycott, Dean, and, now, Sharp Dunn Finally he described certain occasions when Manchester pathologists had led the way They originated the present fever hospital system, to combat the terrible ravages of typhus and small-pox early in the last century They brought to light the connexion between certain trades and cancer They were responsible for Manchester being the first town to adopt the modern bacterial methods of treating sewage They had been pioneers in the use of cod-liver oil medicinally, and in the treatment of cataract, and Percival's medical ethics was still the basis of all recent codes

School of Chiropody, Manchester

The inaugural address at the opening of the School of Chiropody in connexion with the Manchester Foot Hospital was delivered on October 13th by Mr Harry Platt, F R C S, chairman of the hospital It was no necessary, he said, to emphasize the importance of chiropody to-day The conditions of modern civilization were producing an increasing number of minor ailments of the feet, so that the work of the hospital was bound to grow as its services became more widely recognized Chiropody clinics, he thought, should have been instituted by the ordinary general hospitals, just as special clinics were provided for the treatment of the ear and the eye The general hospitals had quite neglected to develop chiropody clinics where patients could be treated at convenient times by qualified practitioners There was no doubt that the Manchester Foot Hospital, which was obviously needed, should take its place with the other hospitals and receive financial support from the public hospital funds Referring to the practical work of the new school Mr Platt said that much of it would be done by students and members of the chiropody staff Criticisms were often made that the student who assisted in the ward of a hospital was learning his profession at the expense of the patient It was well known, however, that the best hospitals were those which provided instruction, the maladies of patients in such hospitals were studied in much greater detail than in hospitals where there were no students At the beginning of their course students were very young, and youth was critical Every teacher knew that it was not easy to blame the young student Reasons had to be substantiated, and this necessity for lucid thinking, stimulated by frequent discussion, led to a crystallization of knowledge that was all to the benefit of the patient Besides the training of students, the school would provide opportunities for post-graduate study This service would be of inestimable benefit, especially to practitioners working in small centres The standard of the curriculum was a high one, and it would not, and should not, be an easy matter to become a qualified chiropodist He wished the new school and the hospital every success

By-laws for Improvement Areas

The Ministry of Health has issued to local authorities a series of model by-laws (Series XIII C) designed to prevent overcrowding and to secure and maintain a proper standard of housing conditions in improvement areas as required by Section 8 of the Housing Act, 1930 The areas, which are defined by Section 7 of the Act, consist of aggregations of houses in varying degrees of deterioration where the general conditions are not so serious as to justify wholesale clearance Among the subjects dealt with in the by-laws are the registration and inspection of houses, the adequate provision of sanitary and lighting facilities, and the regulation of the number of adults and children occupying rooms wholly or partly used as sleeping

apartments Such accommodation must be sufficient to allow the separation of persons of opposite sex over 14 years of age other than persons living together as husband and wife Owners of houses are required to observe certain conditions relating to cleanliness repairs and the ventilation of rooms and closets A special section is devoted to hygienic measures applying to lodging houses and to the precautionary steps that must be undertaken in the erection of new lodging houses to diminish the risks of fire The Minister explains in a prefatory note that these by laws may have to be adapted to local conditions and that experience of the working of the new Act may lead to their modification

Ireland.

Peamount Sanatorium

In the course of her medical report on this institution for 1929 Dr Alice Barry, medical superintendent, states that 857 patients were treated in the sanatorium, the number of admissions being 637, of these, 94 were readmissions The number of patients discharged was 622, including 53 deaths, leaving 215 in the sanatorium at the end of the year The average number of beds occupied during the year was 245 73 compared with 240 34 for 1928 General treatment was carried out on the principle of graduated rest and exercise The enforcing of the necessary periods of complete rest during the day has been found a difficulty, because some patients failed to realize that periods of complete rest were part of a definite treatment Special treatment included the use of pneumothorax apparatus, which was provided during the year In one case where the toxaemic symptoms were very acute there was a rapid abatement in temperature and pulse Sanocrysin was employed in carefully selected cases, but the number was insufficient to give any definite conclusion In others tuberculin was administered with very satisfactory result Ultra violet radiation, as an additional aid in the treatment of non pulmonary cases, was found to increase muscular tone Altogether 74 cases were treated by this method during the year Radioscopic examinations were made in doubtful cases and in cases of lung collapse to note the progress of treatment The children's pavilion, which is an independent unit, continues to be a most important part of the sanatorium During the year 102 children were admitted, 105 were discharged, while the daily average attendance was 34.2 The daily routine of each child is under medical supervision, and consists of alternate periods of rest lessons and play Regular school classes are held in reading writing, sewing, folk-dancing and organized play under a specially trained teacher The co-operation between the nursing and teaching staffs has greatly assisted in making this work a success Both boys and girls hand knit their own jumpers, vests, and stockings, a knitting machine has also been in use for some time Teeth are examined periodically, and treated when necessary at the dental clinic in the sanatorium Two artificial sunray lamps were used during the winter The number of discharged patients is stated to be 7,113, excluding readmissions The annual inquiry has disclosed appalling housing conditions to which some of the patients have to return after a course of treatment in the sanatorium In one case a child discharged as "much improved" returned to live in a small room with ten other people six sleeping in the only bed, and five, including the child in question, on the floor Such information appears to be readily given by the patients themselves

Health of School Children in Northern Ireland.

During the last three months Dr Matilda Matson medical officer under the Health and Well being Scheme has carried out the annual medical inspection in thirty schools in the Eglinton, Culmore Clondermott Ballykelly, and Myroe districts According to her report the greatest improvement was the diminution in the number of cases of defective teeth since the operation of the free dental scheme All the children requiring treatment, however, do not appear to have availed themselves of this opportunity Of twenty two children who were invited to get their eyes tested under the free spectacles scheme only eight attended for this purpose Cases of enlarged tonsils and adenoids are reported to be decreasing many children undergoing operation in the Derry hospitals

Salaries in Rathdown Union

At a recent meeting of the Rathdown Board of Guardians, Dr Boyce (Blackrock) and Dr King (Stillorgan), representing the medical officers in the Rathdown district, requested that the existing scale of salaries should be amended to permit of increased increments and maximal salaries A resolution recommending the application to the favourable consideration of the Department of Local Government and Public Health was passed

Correspondence.

EFFECT OF ACTIVATED FLUORESCEIN ON GROWING BEANS

SIR,—Under this heading in the last issue of the *Journal* (p 643) Dr Sylvia Wigoder gives a brief account of her investigation into the effect of x rays, with and without concomitant use of fluorescein, on growing bean roots Dr Wigoder summarizes her experiments as suggesting that the intensifying action of "activated" fluorescein on x rays is negligible—a statement the meaning of which, however, is somewhat obscure in view of the fact that fluorescein would only be "activated" when irradiated

As regards certain of the experiments described, absence of the "slight difference" observed in the roots that had been both irradiated and treated with fluorescein, and those that had been irradiated only, when the beans were irradiated without being covered with black paper, may perhaps be accounted for by the consequent exposure to light For I have found that peas soaked in a solution of sodium fluorescein and then exposed to sunlight for a brief period may be incapable of germination If however, using the same strength of fluorescein, but with shorter exposure to light growth does occur, this is apt to be delayed, while roots and leaf stalks are stunted in comparison with control seedlings Other possible causes of failure in Dr Wigoder's work are concerned with (1) the reaction of the fluorescein solution, and (2) the amount of "screening" if any of the x rays employed for irradiation no information being afforded on either of these points

In our paper published in the *Journal* last year[1] stress was laid on the fact that it had been found essential, in order to obtain good results in the treatment of cancer, that the reaction of the fluorescein solution should be definitely alkaline Professor F E Fyman, F R S, having pointed out to us that the fluorescent property of the drug is greatly enhanced on passing from a faintly acid or neutral reaction to one of alkalinity In our belief non attention to this point has accounted for absence of success in certain instances in the treatment of cancer cases

In a brief paper recently published Dr Gouldesbrough points out that, for the purpose of exciting the therapeutically important secondary radiation induced when sodium fluorescein is activated by x rays a fairly soft ray is necessary—that is a ray that would not be able to penetrate much below the surface of the body Either a very soft ray or a hard ray did not appear to be of much use" He considers that in order to obtain the desired effect, filtration of the x rays through an aluminium screen 4 mm in thickness is essential Perhaps Dr Wigoder will be so good as to supply further information in regard to the various point to which I have referred—I am etc,

TUBERCULOSIS OF THE TONGUE

SIR,—Para 328 in the *Epitome* in your issue of October 11th has interested me The observation of R D'Arnoy and J W Miller, that lingual tuberculosis is rare, is borne out in my experience I have met with only one case during my eighteen years as tuberculosis medical officer in co Down This patient was first seen by me in April, 1926 He had unmistakable signs of pulmonary tuberculosis, and tubercle bacilli were found in his sputum There was great thickening of the tongue along the left border, and in the thickened portion, on the under side, an elongated ulcer with irregular edges The temperature was ranging between 95° and 101 6° F, but responded favourably to rest in bed When it had ceased exceeding 99° tuberculin treatment was begun by the family doctor under my direction, and has been continued ever since The patient is now on large doses, so is given an injection once in four weeks He returned to his work as a driller in a Belfast shipyard over two years ago and still goes to it, travelling by motor cycle about three miles to the nearest railway station, and completing the journey by tram His general health is good, and he is quite fit for his work The thickening of the tongue has disappeared, and the ulcer has healed, leaving a slightly depressed scar —I am, etc,

Belfast Oct 18th JOHN R GILLESPIE

ANAESTHESIA FOR THROAT OPERATIONS

SIR,—I was very much interested in Mr H G Bedford Russell's statement in his article in the *British Medical Journal* of October 11th (p 594) that "the introduction of a catheter without the help of an ether induction or of the deep sleep afforded by paraldehyde—that is to say, under the influence of gas only—must be regarded as a great achievement throat operations could easily be performed under gas and oxygen anaesthesia only—that is to say, throat operations would be free from any risk of post-operative vomiting"

It may interest Mr Bedford Russell to know that for the last four years I have been giving gas and oxygen endotracheally for operations on the tonsils and jaws, introducing the tube either through the nose or mouth—under gas only At first I used a spray of 10 per cent cocaine, but I found that I could obtain just as good results without any spray at all I first demonstrated this method in Amsterdam in 1927, and have done so in Hamburg (1928), and in Prague and Birmingham (1929) It formed part of the subject of my post-graduate lecture at the Royal Dental Hospital this year, the publication of which gave rise to some correspondence in the *British Dental Journal*

It is quite true that patients who have had their tonsils dissected under gas and oxygen without ether or paraldehyde being used at any time are freed from the risk of post-operative vomiting and recover much better than those who have had the anaesthetics usually employed No premedication is necessary in order to pass the tube under gas, but it makes the process pleasanter for the patient and easier for the administrator When I employ premedication I aim at making the patient drowsy At the demonstration I gave at this year's annual meeting of the British Dental Association I used premedication in one case only—the other two cases had no premedication of any kind—I am, etc,

London W 1 Oct 17th F P DE CAUX

TRACHEAL INTUBATION

SIR,—It probably happens by no means infrequently that methods, etc, which are claimed as novel have actually been described long before, and have either never been adopted or have been dropped after a time The method of intubation described by Mr Bedford Russell in the *British Medical Journal* of October 11th (p 594) is usually regarded as somewhat of a novelty in anaesthetic procedure, and is probably quite correctly ascribed to Magill However, "Kuhn's tube" is figured in the anaesthetic textbooks, and it is interesting to know that the method of intubation of the larynx for therapeutic and anaesthetic purposes was fully described by F Kuhn in various *German medical papers* between 1900 and 1903 The technique for the oral and nasal routes was given in detail, both *with and without* general and local anaesthesia, with full particulars of dimensions of tubes, shape and curvature of stylet, etc Further, it was recommended that all students should become familiar with the manœuvre The anaesthetic used was, of course, chloroform, but the principle was identical—I am, etc,

London, N W 8, Oct 13th R J CLAUSEN,

MARRIAGE OF DEFECTIVES

SIR,—*Much attention has been drawn* in the press to the recommendation of the Board of Control, put forward in its report for 1929, that the marriage of defectives should be prohibited by law The object of prohibiting by law the marriage of defectives is to prevent their procreation This end, however, can be realized (1) more effectively, (2) more humanely, and (3) less dangerously, by making the marriage of defectives conditional on their sterilization *before marriage*

Effectiveness—It is well known that certain high grade defectives are very fertile, and have many illegitimate children One of the acknowledged objects of marriage specified in the marriage service and applicable to normal people is that it acts as a deterrent from promiscuity Why should not this also apply to defectives? If defectives are legally prohibited from marrying, the incentive to promiscuity will be increased and illegitimate children will be born The measure will thus be ineffective in that it will promote illegitimate procreation by defectives

Humanity—Many high-grade defectives have strong sexual needs To deprive such persons of the right to express these needs in lawful marriage is hardly humane Moreover, it is hardly in the interests of children to be born illegitimately of defectives

Social Danger—Much is made by the opponents of sterilization of the argument that the measure would result in the dissemination of venereal disease But many who in one breath condemn sterilization on these grounds, in the next breath advocate the prevention of marriage of defectives as a means of limiting their fertility Such persons are apparently unaware of the inconsistency between these two arguments The increase in promiscuity which would follow from preventing the marriage of all defectives would clearly be accompanied by a dissemination of venereal disease In this sense the prevention of marriage of defectives would be socially dangerous—We are, etc,

PERSONNEL OF A RADIUM CLINIC

SIR,—In Mr Fitzwilliams's letter (October 11th, p 621) there are two statements which call for comment He says "So far the results of x-ray work in the treatment of cancer have been disappointing to surgeons"

In a review[1] of the results of combined radiological and surgical treatment of cancer of the breast at Radium hemmet, 1921–23, the following figures are given under the heading "Percentage of five-year healings by different methods"

Operation only (Nyström) 20–23 per cent
Operation and post operative γ radiation 29 3 per cent
Operation with pre and post-operative x radiation 40 per cent

Turning now to cancer of the cervix uteri "Broadly speaking, the results obtained [by radiation] are equal to those obtained by operation"[2] The treatment mortality of cancer by the various methods is as follows surgery, 17 3 per cent[3], radio active substances with γ ray treatment (Doederlein), 0 6 per cent[4], radium (Stockholm), 2 1 per cent[5] X-ray treatment as an auxiliary to surgery can double the cures in breast cancer, and as an auxiliary to

[1] *Acta Radiologica* April, 1930
[2] Public Health Reports, No 40, p x
[3] Ibid, p 11
[4] Ibid, p 11
[5] League of Nations Health Organization *Cancer Commission* p. 37

treatment by radio-active substances can cure as many cases as surgery, and at the same time reduce the treatment mortality from 17 3 to 0 6 per cent How are these figures disappointing?

Mr Fitzwilliams further says "But if it should be found that these rays have the effect we hope they have, upon deep-seated growths on which radium can hardly be expected to be of use, and the two related wave-lengths prove to be complementary to each other, a position they do not hold to-day, we shall have a pair of weapons for surpassing the use of the knife" A consideration of cervix cases proves incontestably that x rays have a powerful complementary effect The Paris figures (League of Nations Health Organization) are as under

Year	Percentage of Cures	
1919 ..	10	—
1920 ..	17	—
1921 ..	45	A more up-to-date deep therapy apparatus installed.
1922 ..	56	Second deep therapy apparatus installed
1923 ..	30	Deep therapy alone frequently practised

A statistical evaluation of the complementary action of x rays is afforded by the Munich figures, as under [1]

Percentage of Five-year Cures

Group 1—Operable cases Radio-active substances alone 39.3 per cent but when combined with x-ray treatment 41.5 per cent.

Group 2—Borderline cases Radio-active substances alone, 20 9 per cent but when combined with x rays 23.5 per cent

Group 3—Inoperable cases Radio-active substances alone 8 9 per cent but when combined with x rays 13.1 per cent

Thus, even in the very early cases, x rays give an added chance of cure, while in the inoperable cases, for every 8 9 cases curable by radio-active substances alone, 13 1 cases are curable when suitable x radiation is available and applied—I am, etc,

Birmingham Oct 1 th. A A Russell Greig

PYREXIA OF UNCERTAIN ORIGIN

Sir,—The recent reports in the *Journal* of cases of pyrexia of obscure origin prompt me to mention the occurrence of a number of similar cases in this neighbourhood in the autumn of 1928 They were described in a brief note in the *Lancet* (1928, vol ii, p 1050), where I stated that a search for *B faecalis alkaligenes* in one case had proved negative A series of these cases was embodied also in a paper entitled "The problems of some diseases *ex alimentatione* or *ex infectione*," read before the North of England Branch of the British Medical Association in March, 1929

Many of these patients showed symptoms or abdominal disorder, and were sent into hospital for observation, with the tentative diagnoses of appendicitis, cholecystitis, acute abdomen, pneumonia, meningitis, typhoid, and paratyphoid fever One common basal finding in all was acetonuria, and treatment directed to this resulted in the abatement of symptoms Reference to the biochemical findings in some of these cases was published in the *Journal* (1928, vol ii, pp 786 and 838)

In one case where a boy aged 11 was sent in with symptoms of meningismus—cervical rigidity lying curled up on his right side Kernig's and extensor plantar response positive on one side—the condition cleared up in three or four days time Even after he had regained consciousness and was able to sit up in bed acetone was present in very large amounts in his urine the urea figure rose to 4.5 per cent, and later to 5 per cent.

One other boy was a puzzling case He was admitted in September with a history of having had pain in his right iliac fossa since June this had been diagnosed as appendicitis though the symptoms were not at all typical The pain seemed to be more in the muscles In addition he had diplopia and increased right knee jerk and positive extensor plantar response on the same side After a few days the tenderness in the right iliac fossa disappeared but the upper right segment particularly the right rectus was tender Septic tonsils were found and were enucleated The abdominal symptoms with the other signs of nerve disturbance rather suggested the possibility of encephalitis lethargica and its myoclonic abdominal signs Treatment directed to the alkaline condition of his system ended in complete recovery My notes appended to this case were Alkaline type neuro-muscular irritability as in tetany hypocalcaemia induced through presence of a septic focus—tonsils

My interpretation of all the cases seen at this time was that there was some meteorological condition causing a wave of disturbed metabolism (intestinal hepatic, with deficient parathyroid functioning and hypocalcaemia), which explained the neuro-muscular irritability, it was located perhaps in the spinal segments, as also in the brain (cephalic tetany) This aspect seems to receive confirmation from the letter of Dr Peel of Glasgow, when he writes "Such cases are by no means infrequent here" So also are tetany, rickets, and eclampsia I regard the bacterial findings as secondary to the biochemical disturbance—I am, etc,

[1] League of Nations Health Organization Cancer Commission, pp 45-48.

OCCIPITO POSTERIOR POSITIONS

Sir,—Dr Kathleen Vaughan's letter in the *Journal* of July 19th (p 121) is of great interest I have attended Maori women in confinement during the last twenty years or more, and I do not recollect once having to rotate a persistent occipito-posterior position The Maori woman expels her baby in the squatting posture, being assisted by an old woman (or even man), who grasps her firmly round the abdomen from the front

The unnatural posture in defaecation adopted by the civilized person is, in my humble opinion, one of the major causes of constipation, since, the pelvic colon being incompletely emptied, a chronic toxin absorption takes place, which exaggerates the stasis and sets up a spastic condition Dilated and dropped colon, and incompetence of the ileo-caecal valve, combine to produce the picture of visceroptosis If the squatting posture for defaecation were made compulsory in hospitals, by the provision of the pavement closet, I think *there would be a more rapid* recovery of post-operative cases and those of genito-urinary troubles

I have quite recently put this suggestion before the New Zealand Department of Hospitals, but regret to say objections were raised on aesthetic grounds, this hardly displays a proper regard for enterprise, science, or enlightenment—I am, etc,

Whakatane New Zealand, Sept 2nd. J C Wadmore, Medical Attendant to Natives

ANALGESIA IN CHILDBIRTH

Sir,—I was much interested to read Dame A Louise McIlroy's observations on analgesia and anaesthesia in childbirth It is very true that a considerable amount of our maternal death rate is due to lowered resistance from excessive fatigue, shock, and sepsis, the result of withholding relief during labour and during delivery of the head Analgesia in labour has its uses I have given up using drugs for this purpose In the second stage of labour, and at the end of it, I use chloroform Other forms of anaesthesia require an assistant

I am surprised that Dame Louise McIlroy does not mention one extract, which I consider the safest and most effective analgesic I have come across in forty years—ovarian residue without corpus luteum As soon as labour has started an injection of this extract is given in the buttock, and in less than twenty minutes the pains are altered into a strong bearing down without the cramping pain usual in labour, which goes on by itself the patient being encouraged not to bear down for a considerable time—say, an hour The action is contraction of the fundus, the lower zone of the uterus and cervix relax, and the perineum is found to be very lax, and seldom tears, this, I think, is ideal The dose can be repeated every two or three hours if necessary, but usually the case is over long before that Chloroform should always be given when the head arrives on the perineum, and is guided through by manipulation. I have found the extract a

revolution in obstetrics, and it should be used as a routine in every case, it is also useful for the induction of labour

I thoroughly endorse Dame Louise McIlroy's views on the second stage of labour It is certainly advisable that a practitioner should always be in attendance during labour, and adequate financial compensation should be forthcoming Unfortunately this is always on too low a scale in public practice to get the best men Help from the Government should come in the supply of drums and aseptic towels, dressings, etc, and a fee should always be available to procure the assistance of a senior man to help a junior out of trouble, without any thought of the authorities getting the fee back from the patient This would bring our maternity mortality down The general practitioner knows well where the fault lies, but is never consulted —I am, etc,

Wallington Oct 17th A Z C CRISSY

Obituary.

E D WHITEHEAD REID, M B, B CH,

Senior Surgeon and Radiologist, Kent and Canterbury Hospital

DR EDWARD DOUGLAS WHITEHEAD REID of Canterbury, who died on October 20th from injuries received in a flying accident, was one of the first men in this country to own a private aeroplane, and his skill and care as a pilot were recognized in the air service

He was born in 1883 at Canterbury, where his father, the late Dr T Whitehead Reid, F R C P, held a leading position From Tonbridge School he went to Christ's College, Cambridge, graduating B A in the Natural Sciences Tripos, and thence to St Bartholomew's Both at Cambridge and at hospital he distinguished himself in athletic sports After obtaining the English Conjoint diplomas in 1909 he served as house-physician at St Bartholomew's, and house-surgeon at the London Temperance Hospital, and proceeded to the M B and B Ch degrees in 1910 He then made several voyages as ship surgeon, and, returning to take up his father's practice, was soon elected to the surgical staff of the Kent and Canterbury Hospital He was also appointed medical officer to King's School, Canterbury, and interested himself in ambulance work and the training of midwives During the war he served with a temporary commission in the R A M C at No 1 British Red Cross (Duchess of Westminster's) Hospital, near Etaples, and subsequently in Egypt, where he learnt to fly when acting as surgeon and radiologist to No 31 General Hospital After the war he resumed civilian work at Canterbury, and in addition to his hospital duties and a considerable private practice, he undertook the post of surgeon to the local Venereal Disease Clinic, and became consulting surgeon to the Herne Bay Hospital and the Canterbury Mental Hospital

As may be gathered from this brief record of a life cut short in its prime, Douglas Whitehead Reid was a man of abundant energy, resourceful, enterprising, and businesslike in the arrangement of his day's work It speaks much for the impression he made upon people that within a few months of his return to the place where he had been known as a boy he was able to hold together the practice built up by his father, and to secure election to the hospital staff His schoolfellows and contemporaries at Cambridge and Bart's will long remember him as a man always keen, always striving, always living intensely and enjoying life At the end of the war the ban on his unauthorized enthusiasm for flying was raised, and he was able to join an auxiliary branch of the R A F M S This made him extremely happy

---

DR HARRY GEORGE CRITCHLEY, who died on October 11th at Croydon suffered much from ill-health in his later years Yet through discomfort and pain, he maintained an equanimity of bearing that was enviable and exemplary It may have been that this behaviour was a continuing characteristic of his life, for he was always best in work where patience was most needed He was born at Inverness in 1864, and received his medical education at the universities of Durham and Edinburgh, graduating M A Dunelm in 1895 and M D Ed in 1889 As an ophthalmic surgeon he worked much among children For many years he served as one of the part-time oculists in the London County Council schools and in the school clinics His clinical work was uniformly thorough and good He was also ophthalmic surgeon to the large Reedham Orphanage at Purley, Surrey, and had served as senior clinical assistant at the Royal Eye Hospital and other hospitals In his earlier years he had some thought of engaging in public health work, and consequently took the D P H of the Royal Colleges of Ireland Though he settled in practice as an ophthalmic surgeon in Harley Street and Croydon, Dr Critchley's work in this direction was not wasted, for in ophthalmology he considered the bearings of the condition of the homes of the children, of the equipment and management of the schools, and from a standpoint wider than that common to eyeworkers This was shown in his report to the Education Department on the eyesight of *children attending elementary schools*, which appeared in 1898 He was a prominent Freemason, and many friends in Croydon and elsewhere will miss him

---

By the death of Dr W H PAYNE of Blackheath, on October 14th, the Greenwich and Deptford Division of the British Medical Association has lost a member who, from the beginning of his career, unselfishly devoted a large part of his time and energy to the service of his fellow practitioners William Henry Payne was born in 1870, and received his medical education at University College, London He obtained the diplomas M R C S, L R C P, in 1893, and graduated M D of Durham University in 1911 On the formation of the Greenwich and Deptford Division in 1912, Dr Payne became its secretary, and during his tenure of office was largely instrumental in starting what has now become the Greenwich and Deptford School Clinic Association There was thus secured for the local practitioners a considerable amount of work which would have otherwise been undertaken by a *full time* medical officer appointed by the London County Council The organization of the clinic involved a considerable amount of negotiation and correspondence, which was mostly conducted by Dr Payne himself In 1916, though over the age limit, he offered his services and received a temporary commission in the R A M C, serving in the hospital ship *Britannic*, and being on board when she was torpedoed in the Aegean Sea He sustained a fracture of the left ankle, was invalided home, and undertook duties in connexion with the R A F until the end of the war A colleague writes Dr Payne was one of the most kind-hearted of men He was endowed with a fund of humour, which made it always a pleasure to meet him Many an eye brightened at his approach, and the tedium of many a sick-bed was relieved by his cheery sympathy With courage and patience he endured his last, long, and disabling illness, astonishing his friends with the cool detachment with which he discussed his symptoms and their significance

---

The death occurred at his residence, Colonsay House, Auchterarder, on October 8th, of Dr JAMES MACFEE, who had practised in that town for about forty years Dr Macfee was born at Colonsay, Argyllshire, in 1845, and studied medicine at Edinburgh, obtaining the diplomas of the Colleges of Physicians and Surgeons in 1870 Shortly afterwards he succeeded to his uncle's practice at Auchterarder, which he continued till 1909, when he retired For many years he was medical officer of the parish of Auchterarder and Trinity Gask Dr Macfee was keenly interested in the Volunteer movement, and ultimately held the rank of surgeon lieutenant colonel in the 4th Volunteer Battalion of the Royal Highlanders He was a keen curler and golfer, and took a great interest in freemasonry

---

Mr T GLENTON-KERR, for thirty-seven years secretary of the Queen's Hospital for Children, Hackney Road, London, E, died on October 15th after a short illness

UNIVERSITY OF GLASGOW

A GRADUATION ceremony was held in the Bute Hall on October 15th when Dr R S Rait Principal and Vice-Chancellor presided and conferred degrees upon the successful candidates The degrees of M B and Ch B were conferred upon the 69 candidates whose names were printed in our issue of October 11th (p 635)

The Brunton Memorial Prize for the most distinguished graduate in medicine for 1930 has been awarded to J Ferguson Heggie The West of Scotland R A M C Memorial Prize awarded to the candidate with the highest aggregate marks in medicine surgery and midwifery in the final examination for the degrees of M B and Ch B held during 1930 has been gained by William S Mack

In his address to the new graduates Principal Rait referred to the fact that they had graduated on St Luke s Day and spoke particularly to the medical graduates of the ideals, duties and responsibilities of their profession

ROYAL COLLEGE OF SURGEONS OF ENGLAND

Museum Demonstrations

THE autumn course of museum demonstrations at the Royal College of Surgeons of England will commence on Monday, November 3rd when Mr D H Patey will demonstrate specimens illustrating the pathological conditions of the salivary glands Sir Arthur Keith will give three demonstrations on November 7th he will describe specimens of surgical interest recently added to the museum, on November 14th he will give an account of Colonel McCarrison s experiments in the production of urinary calculi with an exhibition of his specimens and on November 21st he will demonstrate specimens illustrating the enlargement of the prostate with an account of present-day knowledge concerning the etiology of the condition On November 10th and 17th Mr Cecil P G Wakeley will demonstrate specimens illustrating the pathological conditions of the scalp and cranium and of the spine and spinal cord The demonstrations which are open to advanced students and medical practitioners, will be given in the theatre of the College Lincoln's Inn Fields, W C , at 5 p m

Annual Meeting of Fellows and Members

A meeting of Fellows and Members will be held at the College in Lincoln s Inn Fields on Thursday November 20th at 3 p m when a report from the Council will be presented Fellows and Members can obtain copies of the report on application to the secretary and can if they so desire have their names placed on the list of those to whom the report is sent annually Motions to be brought forward at the meeting must be signed by the mover or by the mover and other Fellows and Members and must be received by the secretary not later than November 10th A copy of the agenda will be issued on or after November 14th to any Fellow or Member who applies

ROYAL COLLEGE OF SURGEONS OF EDINBURGH

AT the meeting of the Royal College of Surgeons of Edinburgh on October 14th Dr James Haig Ferguson was re-elected president for the ensuing year Mr Alexander Miles LL.D vice president and Mr John William Struthers, F.R.C.S Ed , secretary and treasurer

The following 48 successful candidates (out of 106 entered), having passed the requisite examinations were admitted Fellows

ROYAL COLLEGE OF PHYSICIANS OF IRELAND

THE annual meeting of the Royal College of Physicians of Ireland was held on St Luke s Day October 18th Drs Edward Keelan John Tait and Frederick MacSorley were elected Fellows

Professor T Gillman Moorhead was elected president and Dr William J Dargan vice president The following were elected censors of the College Medicine Dr Geoffrey Harvey and Dr Robert Marshall, medical jurisprudence and hygiene, Dr William J Dargan midwifery, Dr Gibbon FitzGibbon

The following officers were re-elected Representative on the General Medical Council, Sir John Moore treasurer Dr H Bewley, registrar, Dr T P C Kirkpatrick, librarian, Mr R Phelps

The representatives on the committee of management under the conjoint examination scheme were re-elected as follows Dr Walter Smith Sir John Moore and Dr T P C Kirkpatrick

Dr G E Nesbitt presented to the College a portrait of the late Dr H C Earl

The Services

HEALTH OF THE ROYAL AIR FORCE.

THE state of affairs described in the recently issued report[1] on the health of the Royal Air Force for the year 1929 is on the whole very satisfactory The figures relating to sickness, deaths, and invaliding from the Service are it is true slightly higher than those recorded in 1928 but they are still well below the averages of the two earlier periods 1921-24 and 1925-28 A heavier incidence of influenza and tonsillitis at home and of malaria abroad, was responsible for the greater part of the increased sickness rate, on the other hand, it is satisfactory to note that the amount of venereal disease was appreciably less than in the previous year, the present rate—15 per 1,000—being the lowest so far recorded The increased sickness rate notwithstanding the average duration of sickness per head has undergone decided diminution and the constantly sick figure—24 3 per 1 000—compares not too unfavourably with the figure—23.2—recorded in 1923 Study of a table in which the total sickness of the Force is classified into a large number of etiological groups shows that in the year under review 83 5 per cent of the total sickness was associated with disease and 16 7 per cent with injury A comparison of these figures with those recorded for 1923 (81 6 and 18 4) and with the averages over the two previous periods (83 5 and 16 5 and 86 2 and 13.8 respectively) reveals a slight tendency on the part of injury to increase progressively in its proportion of the total non effectiveness The increase in the rate of invaliding from commands abroad to the United Kingdom—18 4 per 1 000 as against 17 per 1,000 in 1928—was largely due to cases of the enteric group sent back from Iraq in order of frequency the diseases for which cases were transferred to the home establishment were conditions resulting from injury the enteric group of infections psychoneuroses diseases of the urinary system and pneumonia Compared with 1928 there were decreases in the figures representing final invaliding from the Service on account of psychoneuroses, defective vision and fractures but increases in the numbers invalided for tuberculosis valvular disease of the heart chronic suppurative otitis media and mental diseases The final invaliding rate rose to 7 6 in 1929 from 6 2 in 1928 but still compares favourably with averages over the preceding periods. There were 72 deaths from injury compared with 97 in 1928 and in that year there were 40 deaths from disease compared with only 33 in the year under review An investigation into the effects of fast flying and intensive aerobatics which was completed during the year, showed that no special methods beyond those of the ordinary routine examination were required in the selection of personnel for high speed flying and that the rotation te employed at the Central Medical Establishment to ascertain suitability for aerobatics was as precise in its indications as the whirling arm specially designed for this purpose It was found also, that, though medical examinations during the period of training for high speed flying were unnecessary, it was desirable that the training should be under medical supervision According to the report blacking-out — ne chief

[1] Report on the Health of the Royal Air Force for the Year 1929 London H.M. Stationery Office 4to 1s 3d net

effect of steep banking at high speed—seems to be due to withdrawal of blood from the eye itself, and thus, beyond affecting vision, not to incapacitate the individual to a degree that would render management of the aircraft impossible It is suggested that the dimming, or blacking out, should be regarded by pilots as a warning not to increase these effects by turning further

SIXTH INTERNATIONAL CONGRESS OF MILITARY MEDICINE AND PHARMACY

WE have just learned that the sixth International Congress of Military Medicine and Pharmacy will take place at The Hague, from June 1st to the 6th, 1931

The subjects, in chronological order, are as follows (1) Recruiting, establishment, and training of military surgeons and pharmacists (contributors Holland and Jugo Slavia) (2) The psychoneuroses of war, immediate and remote effects of war on the nervous system of soldiers and civilians (contributors France and United States of America) (3) The treatment of haemorrhage on the battlefield, the most urgent remedies essential, and some conditions of their application (contributors Holland and Italy) (4) The preparation and preservation of medicines in tablet form used in the medical services of the Navy and Army (contributors Holland and Rumania) (5) The after effects of war injuries of the teeth and the lower jaw and their treatment (contributors Holland and Poland)

Numerous entertainments and receptions are being organized The Hospitality Committee will arrange accommodation for those attending the congress either at The Hague or at Scheveningen, a watering place about three kilometres from The Hague, situated in beautiful surroundings The committee of the congress is organizing at the same time a historical exhibition of the sanitary services of the sea, land, and air forces This exhibition will include illustrations, documents, instruments, equipment, uniforms of the officers of the sanitary service, etc All Governments have been requested to collaborate by sending exhibits to this artistic and historic display, which should be of the greatest interest The committee in charge of the exhibition is composed of Le Médecin Principal de premiere classe Denekamp, Dr de Lint, Associate Professor of the History of Medicine in the University of Leyden, le Médecin Major deuzieme classe Doornicky and Dr Molema (Netherlands Red Cross) All inquiries should be addressed as follows Direction du Service de Santé, Ministère de la Guerre, La Haye, Holland

The Royal Naval Volunteer Reserve Officers' Decoration has been awarded to Surgeon Commander W C Macartney

DEATHS IN THE SERVICES

Colonel Andrew Lang Browne, late R A M C *died in a* nursing home on October 6th, aged 81 He was born on October 24th, 1848, the second son of the late Dr Browne of Dundalk graduated as M D in the Royal University of Ireland in 1871, and entered the Army as assistant surgeon on March 30th, 1872 *He attained the rank of brigade surgeon* lieutenant colonel on July 6th, 1896, and retired on July 19th, 1899 He was promoted to colonel on the retired list from October 18th, 1902, for his services when employed at Warley Barracks during the South African war of 1899-1902 He also rejoined for service in England during the war of 1914-18

Colonel Joseph Thomas Daly, Bengal Medical Service (ret), died on June 28th, aged 68 He was born at Donnybrook, Dublin, on January 3rd, 1862, the son of James Daly, surveyor, and was educated at the Catholic University, Dublin, graduating as M D, with honours, and M Ch in 1884 in the Royal University of Ireland Entering the I M S as surgeon on April 1st 1886, he reached the rank of colonel on April 1st, 1915 *and retired on April 1st, 1920* His whole service was spent in military employ He served in the Waziristan campaign of 1894 95, on the North West Frontier of India (medal with clasp), in China in 1900 (medal) on the North West Frontier in the Mohmand expedition of 1908, taking part in operations in the Zakka Khel and Mohmand country (medal with clasp), and in the war of 1914-18, in Gallipoli

Lieut Colonel Robert Cardwell Gunning, R A M C (ret), died at Croydon on October 7th, aged 76 He was born at Lunsk illen on October 26th, 1853, and was educated at the Ledwich School, Dublin, taking the L R C S I and L K Q C P in 1876 Entering the Army as surgeon on February 4th, 1877, he became lieutenant-colonel after twenty years' service, and retired on May 25th, 1904 He served in the South African war in 1901-2, as P M O of No 22 General Hospital, and took part in operations in the Transvaal and Cape Colony, receiving the Queen's medal with four clasps He was re employed during the war of 1914-18, from September 24th 1914

Medical News.

AT the opening meeting of the Section of Medicine of the Royal Society of Medicine on Tuesday, October 28th at 5 p m, there will be a discussion on research in clinical medicine, to be introduced by Dr J A Ryle, Professor H Francis Moore, and Dr Helen M M Mackay The openers will deal briefly with the natural scope and limits of clinical research and the measures, if any, which should be taken for its direction and encouragement

THE Minister of Health will deliver the opening address at a joint conference on the problems of physical and psychological defects which will be held by the Invalid Children's Aid Association and the Central Council for the Care of Cripples on November 13th and 14th at the Drapers' Hall, Throgmorton Street, E C Among the subjects to be discussed are the prevention and treatment of crippling diseases and of rheumatic heart disease, the industrial outlook of the *physically disabled, and the problem of the backward and* difficult child Visits are contemplated to various institutions on November 12th and 15th For those attending the conference arrangements have been made with the railway companies in Great Britain to issue return tickets at the price of the ordinary single fare and a third (minimum fare 1s) The conference fee is 5s Tickets and railway vouchers may be obtained on application to either of the honorary secretaries at Carnegie House, 117, Piccadilly, W 1

MR V E NEGUS will deliver the Semon Lecture in the Barnes Hall, 1, Wimpole Street, W, on Thursday, November *6th, at 5 p m The chair will be taken by Mr Frank Rose,* president of the laryngological section of the Royal Society of Medicine The subject of the lecture is "Some observations on Semon's law" (derived from evidences of comparative anatomy and physiology)

THE annual dinner of the Society of *Medical Officers of* Health will take place at the Piccadilly Hotel on November 13th, at 7 15 p m On November 14th Professor David Burns will discuss some points of contact between preventive medicine and physiology A discussion on undulant fever will be opened at the meeting on December 19th by Mr D S. Rabagliati and Sir Weldon Dalrymple Champneys At the general meeting on January 16th, 1931, Dr Millais Culpin will speak on neuroses and the public health On February 20th Dr J A Charles and Dr S H Warren will open a discussion on bacillary dysentery in Great Britain On April 17th Dr Ethel Cassie and Dr G C M M'Gonigle will discuss the pre school child The meetings will take place at 1, Upper Montague Street, W C 1, at 5 p m

THE new session of the Chelsea Clinical Society will open with the annual dinner at the Hotel Rembrandt, Thurloe Place, S W, on Tuesday, October 28th, at 8 p m On November 18th Dr Anthony Feiling will open a discussion on the treatment of headache, and on December 16th a discussion on the treatment of fibrositis will be opened by Dr R L Jones Llewellyn At the meeting on January 20th, 1931, there will be a discussion on the treatment of eczema, to be opened by Dr H MacCormac A discussion on the treatment of glandular deficiencies will be opened by Dr W Langdon Brown on February 17th, and on March 17th the president of the society, Dr F J McCann, will open a discussion on the treatment of menstrual irregularities Sir Farquhar Buzzard will open a discussion on the treatment of nervous exhaustion on April 21st, and on May 10th a discussion on treatment before and after operation will be opened by Mr Lawrence Abel

FOUNDERS' Day at the National Hospital for Nervous Diseases, Queen Square, Bloomsbury, will be commemorated on November 5th by a short thanksgiving service at 3 p m, when the Rev B G Bouchier, Rector of St Anne's, Soho, will give an address During the afternoon visitors may inspect the hospital, this being the seventieth anniversary of *its opening*

A SERIES of popular demonstrations, illustrating science in everyday life, is to be given at the Portland Hall, Regent Street Polytechnic, in aid of King Edward's Hospital Fund for London The first will take place on Wednesday, October 29th at 5 30, when Dr Walter Clark, director of research laboratories, Kodak Ltd, will trace the development of photography, by description and demonstration, from the daguerreotype down to modern processes, including x ray photography, colour photography, and cinematography Later demonstrations will deal with the story of sound production (the gramophone etc), sound photography (the talking film), illumination, and dyeing For full particulars and prices of tickets application should be made to the secretary, King Edward's Hospital Fund for London, 7, Walbrook, E C 4.

THE Fellowship of Medicine announces that special lectures for the M R C P course during this week will be delivered at the Medical Society lecture room, 11 Chandos Street Cavendish Square, W 1 at 8 30 p m , on Tuesday, October 28th, by Dr Donald Hunter (prevention of disease in industry pathogenesis and treatment of lead poisoning), and at the same time on Friday, October 31st, by Dr Maurice Cassidy (coronary occlusion) Tickets, price 10s 6d each lecture are obtainable at lecture room On Monday, October 27th, at 4 p m , a free lecture will be delivered at the same place by Sir James Purves Stewart on the diagnosis and treatment of disseminated sclerosis A free demonstration of the injection treatment of varicose veins will be given by Mr R C Ledlie at the Miller General Hospital on Thursday October 30th at 11 a m A comprehensive morning course will be held at the Great Ormond Street Hospital for Children from October 27th to November 8th At the Royal National Orthopaedic Hospital there will be an all day course from October 27th to November 8th, and an afternoon course at the Royal Westminster Ophthalmic Hospital from October 27th to November 15th The subjects of the November special courses are ante natal treatment and diagnosis venereal diseases, medicine, surgery, and gynaecology diseases of the chest, and proctology Detailed copies of syllabuses and the list of 1931 special courses may be obtained from the secretary of the Fellowship, 1, Wimpole Street, W 1

THE new courses of afternoon lectures at the Royal Institution of Great Britain 21, Albemarle Street, W 1, will commence on Tuesday November 4th, at 5 p m , when Dr C D Ellis F R S will deliver the first of two lectures on new aspects of radio activity the second lecture will be given on November 11th On Thursdays November 6th and 13th, at 5 p m , Mr J B S Haldane Fullerian Professor of Physiology, will lecture on the physiology of water Dr L C Martin assistant professor, Technical Optics Department, Imperial College of Science, will lecture on colour vision on November 20th and 27th at 5 p m

THE Chadwick Trustees have issued a report of the work of three scholars whose appointments were recorded in the *Journal* of August 10th 1929 (p 283) Dr Bach lectured on his results on October 23rd and Mr Elsby will report his findings with regard to the silica dust problem in a Chadwick public lecture to be given in London in the early part of next year These Chadwick scholarships are tenable for one year, and are of the value of £400 each Further information about them may be obtained from the secretary of the trustees, Mrs Aubrey Richardson, 204, Abbey House, Westminster S W 1

THE Bridge of Allan Spa Stirlingshire, will be formally re opened on Thursday October 30th, at noon, by Sir Humphry Rolleston Bt , G C V O

TWO nursery schools have been opened by the London County Council in East London, each having accommodation for 150 boys and girls between the ages of 2 and 5 The children will be trained to form good habits, to keep themselves clean to be tidy, and to do things for themselves Attractive occupations games, exercises, and rest under healthy conditions are being provided for them The schools are open from 8 30 a m to about 4 p m the children remain there between those hours, lunch dinner, and tea being provided for them at a charge of 6d a day Children living within about three-quarters of a mile, whose attendance at a nursery school is desirable for their healthy physical and mental development, are eligible to attend They may be nominated for admission by the medical officer of health for the borough, head teachers of infants schools near by and the Council s district organizer of care committees, divisional officer and divisional medical officer

THE first British Empire Red Cross Conference was held in London last May references to it appeared in our issues of May 24th (p 958) and May 31st (p 1015) The official report of the conference has now been published it contains a large amount of information about the varied activities of the British Red Cross Society at home and overseas Mention is made of the medical attention given to the pioneer settlers in Canada India, Australia, and elsewhere conducting of the first aid service for the roads and for large meetings, provision of medical supplies and hospital libraries the administration of medical institutions establishment of the research and treatment clinic for rheumatism organization of a blood transfusion service and the promoting of general health education In Canada fifty four outpost hospitals are kept in operation by the society while seven sanatoriums and convalescent homes have been established in Australia for the treatment of tuberculous patients and their families More than 200 child welfare centres have been opened in India and in the great Assam flood last year 50 000 persons were inoculated against cholera This report may be obtained from the offices of the society, 14, Grosvenor Crescent, S W 1

AN international medical tour will be conducted from December 26th to January 8th, visiting Marseilles, Toulon, Hyères, Saint Raphael, Cannes Nice Bordighera, Monaco, and other places of interest Full information as to the cost of this tour and the various festivities in connexion with it may be obtained from the secretary at the Federation of the Health Resorts of France, Tavistock House (North), Tavistock Square, W C 1

MESSRS H K LEWIS AND CO , LTD , announce for early publication *The Treatment of Asthma*, by Dr A H Douthwaite *Stepping Stones to Surgery* (anatomy applied to surgery) by Mr L Bathe Rawling, and *Diseases of the Tongue*, by Mr W G Spencer and Mr Stanford Cade being the third edition of Butlin and Spencer s work bearing the same title

THE eighth volume of the *Guide to Current Official Statistics of the United Kingdom* provides a systematic survey of the statistics appearing in all official publications issued in 1929 by Government Departments in Great Britain and Northern Ireland In the case of each publication an account is given of the nature of the statistics therein contained, their mode of analysis, and the time and place to which they relate It is thus possible to discover which of the many Government publications issued each year furnishes statistics required for any particular purpose in relation to such topics as, for example, the state of the public health, unemployment, and research The volume is printed and published by H M Stationery Office at the price of 1s net

AN article describing a method of continuous colon irrigation by Dr T C Graves and Mr D E Turner, which appeared in the April issue of the *Journal of Mental Science*, has now been reprinted in pamphlet form The "Rubery Hill table," designed by the authors for facilitating such irrigation, is a modification of the Trenton table, which Dr H A Cotton installed some time ago at the New Jersey State Hospital An account is given of the way in which treatment is administered, and the value of such continuous irrigation is discussed

AN association of members of the Chartered Society of Massage and Medical Gymnastics in private practice has published a directory giving the names, addresses, and qualifications of its members, and the work they are prepared to undertake They have adopted regulations which pledge them to work only under the direction of a registered medical practitioner The names in the directory are arranged according to the counties in which the members live The price is 1s , copies may be obtained from the secretary of the Private Practitioners Association, Hygeia, Falmouth, Cornwall

WE referred at length in the *Journal* of September 27th (p 536) to the presentation by Miss Susan Lawrence M.P , of an account of the health activities of the League of Nations Readers may be interested to know that her speech has now been printed and may be obtained from Messrs G Allen and Unwin, Ltd , price 6d

DR. EMILE DE GROSZ professor of ophthalmology at the University of Budapest, is visiting the United States, and will deliver lectures in Philadelphia, Chicago Minneapolis, and Rochester The American College of Surgeons during its coming meeting in Philadelphia, will confer upon him its honorary fellowship

THE German Society for Combating Quackery will hold its annual meeting at the Kaiser Friedrich Haus in Berlin on October 27th

AT its meeting on October 7th the Académie de Medecine on the proposal of Professor Vincent, resolved that a note of condolence should be sent to the Royal College of Physicians on the occasion of the disaster to R.101

THE Alvarenga prize for 1930 has been awarded to Dr Henry A. Harris, London, for an essay entitled 'Cod liver oil and the vitamins in relation to bone growth and rickets The College of Physicians of Philadelphia announces that the next award of this prize amounting to about 300 dollars will be made on July 14th 1931 Essays should be typewritten and unsigned, but plainly marked with a motto and accompanied by a sealed envelope having on its outside the motto of the paper, and within the name and address of the author, they must be sent to the secretary of the College, 19 South 22nd Street Philadelphia, on or before May 21st, 1931 The successful essay will remain in the possession of the College, but with its consent may be published by the author Rejected essays will be returned upon application within three months of the award

PROFESSOR MAX PLANCK has succeeded Professor Harnack as president of the Kaiser Wilhelm Society for the Advancement of Sciences, Berlin

A PAEDIATRIC society has recently been founded at Bahia, under the presidency of Dr Martagao Gesteira

Letters, Notes, and Answers.

All communications in regard to editorial business should be addressed to ***The EDITOR, British Medical Journal, British Medical Association House, Tavistock Square, W C 1***

ORIGINAL ARTICLES and LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone unless the contrary be stated Correspondents who wish notice to be taken of their communications should authenticate them with their names, not necessarily for publication

Authors desiring REPRINTS of their articles published in the *British Medical Journal* must communicate with the Financial Secretary and Business Manager, British Medical Association House, Tavistock Square, W C 1, on receipt of proofs

All communications with reference to ADVERTISEMENTS as well as orders for copies of the *Journal*, should be addressed to the Financial Secretary and Business Manager

The ***TELEPHONE NUMBERS*** of the British Medical Association and the *British Medical Journal* are *MUSEUM 9861, 9862, 9863,* and *9864* (internal exchange, four lines)

The ***TELEGRAPHIC ADDRESSES*** are

EDITOR OF THE *BRITISH MEDICAL JOURNAL, Aitiology Westcent, London*

FINANCIAL SECRETARY AND BUSINESS MANAGER (Advertisements, etc), *Articulate Westcent London*

MEDICAL SECRETARY, *Mediocera Westcent London*

The address of the Irish Office of the British Medical Association is 16 South Frederick Street, Dublin (telegrams *Bacillus, Dublin*, telephone 62550 Dublin), and of the Scottish Office 7, Drumsheugh Gardens, Edinburgh (telegrams *Associate, Edinburgh*, telephone 24361 Edinburgh)

QUERIES AND ANSWERS

TREATMENT OF EXOPHTHALMIC GOITRE

"D B F" writes I should be glad to hear of any drawbacks or evil resulting from the treatment of Graves's disease by tincture of iodine In my own limited experience of three cases I have had the most satisfactory results

CHRONIC BRONCHORRHŒA AFTER GAS POISONING

"GASSED" (Arnside) asks for guidance in the following case A man of 46 was badly gassed in the war, and ever since has suffered from bronchitis Each day he expectorates from one to one and a half pints of bronchial secretion He coughs and expectorates all day Inhalations and all the usual antibronchitic remedies have availed nothing, morphine and its relatives cause immediate nausea There is no indication of tuberculosis and no gross cardiac lesion Vaccine treatment has not been tried, as no specific or pathogenic germ is present Any suggestion from those who have had experience in such cases would be gratefully accepted

SOUND PROOF PARTITIONS

DR E SHIRLEY JONES (Bentley, Hants) writes in reply to the query printed last week (p 670) 'D M O" should use 'Cabot's quilt, obtainable from any builder This consists of American eel grass sewn between thick brown paper It is light, sound proof and fireproof It is cheap and he should not stint thickness unduly I have used it with satisfaction between surgery and waiting room

"F W L" writes "D M O" will be wise not to rely solely on material to exclude noise but to adopt some method of baffling, by fixing sheets of material at different angles inside a cavity partition I have just had a door made leading from my waiting room to my consulting room, the material used being "celotex," and I find it satisfactory A previous door, although it had a cavity and also a loose flock packing was useless, largely because the facing was of ply wood I believe A partition should lend itself better than any door to the method I suggest

EPHEDRINE

DR M R SAGAR (Plymouth) writes In reply to the inquiry of M M M in the *Journal* of October 11th (p 625), I would suggest that in such cases the ephedrine causes a spasm of the trigonal sphincter—through stimulation of the sympathetic in the pelvic plexuses—and so inhibits micturition I have had two such cases, both patients being elderly men, little, thin, 'shrivelled" looking, and arterio sclerotic, who refused to take it on this account, and in both cases, after an interval of several weeks, I persuaded them to try it again, when there was no such effect, nor has it occurred since One man is now dead but the other still takes it—by mouth—for his asthma with good results, and experiences no difficulty in micturition Atropine is antagonistic to adrenaline, and therefore, presumably to ephedrine, but apparently in one of my cases (the second), at any rate, tolerance was established, for he had burnt and inhaled the fumes of pulv stramon co from the first

'H C M" writes During an attack of asthma at 11 p m a 1/2 grain tablet of ephedrine was swallowed by me, with a good deal of relief At 6 30 a m for a few minutes, though the desire to micturate was great I was unable to pass urine, after those few minutes it was passed with pain and difficulty Burroughs Wellcome and Co in their description of ephedrine, state that in some cases it causes bladder irritation

LETTERS NOTES ETC

MEDICAL GOLF

THE autumn meeting of the London Irish Medical Golfing Society was held at Sandwich on October 11th About 65 players took part, and the competition was very keen The results were as follows

Captain's Prize (best gross)—F T Wright 81+79=163, D J O Keeffe 85+80=165, A G Walsh 82+86=168

Cahill Trophy (best nett)—F J Holmes (18) 77+78=155, R H Jones (17) 76+80=156 T Mayberry (16) 84+72=156

Lett Cup (foursomes)—D S Gordon and G Campbell 3 up A G Walsh and W Macarley 1 up, M J Smyth and A Perry 1 down

O'Malley Cup (18 holes)—G Sneyd (14) 2 up, R Seale (8) 1 up

Canny Ryall Cup—T Mayberry 88—16=72 F M Donahue 90—15 75 M J Smyth 81—6=75, J Gubbins 95—18=77, R Lilles 91—11=77 E T Wright 79—2=77

Juniors Prize T Mayberry *Veterans Prize* E M Donahue *Selective Prize* T J Hollins *Guests Prize* Colonel Mucke

THE autumn meeting of the Medical Golfing Society was held at Littlestone on October 18th and 19th The splendid weather and the excellent condition of the course were greatly appreciated by the 75 competitors The results were as follows

Singles v Bogey—Mather Thomson 2 up

Foursomes v Bogey—D J O Keeffe and H W Molesworth tied with Commander Rusack and A Gallotly, the former couple winning on the first nine holes

Canny Ryall Cup—D Light 85—12=73, Eric Dobson and T A Torrance 74 net

Scratch Prize—T A Torrance 71

Veterans Cup—D Light

PLATT POWDERS

"J W C" writes Much attention has recently been paid to the addition of preservatives to foodstuffs, but I cannot call to mind any reference to the effect on health of the remains of various cleaning materials left adhering to silver and other table furniture, with the exception of some instances of cyanide poisoning after the use of a silver cleaner containing a cyanide It may be that the ingredients of most of the common metal cleaners on the market are innocuous, but I have a suspicion that I have not profited by the absorption of small quantities of some of them which careless domestics have failed to dislodge after their cleaning operations An authoritative pronouncement on the composition of these cleaners would be welcome

MEDICAL ART CALENDAR

HOLLAND is the home of medical art, and it is natural that from that country we should receive a copy of the Medical Art Calendar, an annual publication from the house of J P Kruseman, Noordeinde 91, The Hague, Holland In recommending the 1931 calendar to our readers, we can say with confidence that it is better than ever, and, *considered* from all points of view, it is a most elegant addition to the consulting room or study It might even be included in the literature of the waiting room, so that the apprehensive patient, full of speculative imaginings, may calm his ruffled mind by contrasting the crude alchemy of a savage past with the scientific perfection of the treatment he is about to undergo The price of the calendar is 6s (post free)

A PANEL OF EXPERT TRANSLATORS

IN the *British Medical Journal* of June 21st (p 1155) some particulars were given of a panel of expert translators which is in course of formation by the Association of Special Libraries and Information Bureaux The services of this panel, which consists of members having both linguistic and technical qualifications of a high standard, are now available for specialized work in all branches of knowledge We are informed that a large number of translators familiar with medical subjects have been enrolled The services of the panel are free to members of the association, to others a charge of 2 guineas is made for each name and address supplied Further details may be obtained from the secretary of the association, 26, Bedford Square, W C 1

NUMBER PLATES ON MOTOR CYCLES

THE Automobile Association has been requested by the police authorities to draw attention to the new regulations governing number plates on motor cycles, which came into operation on October 6th Under these the size of the lettering on the rear number plate is increased, and the rear number plate has to be illuminated Full particulars of the requirements are given in the booklet *Motor Law*, a copy of which may be obtained by motorists free of charge on application to any A A office

EVANS'S annual medical price list has been issued this month in a revised form A copy will be sent to any medical practitioner or medic to Evans's Biological Institute, Higher

VACANCIES

NOTIFICATIONS of offices vacant in universities, medical colleges, and of vacant resident and other appointments at hospitals will be found at pages 46, 47, 48, 49, 53, and 54 of our advertisement columns, and advertisements as to partnerships, assistantships, and locumtenencies at pages 50 51, and 52.

A short summary of vacant posts notified in the advertisement columns appears in the *Supplement* at page 187

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine.

368. Estimation of Circulatory Fitness

L. J. MACKENZIE, P. V. WELLS, E. C. DAVIS and L. S. LEVISAKER (*Amer. Journ. Med. Sci.*, September, 1930, p. 372), in a preliminary report upon an improvement they have devised in testing circulatory fitness, point out that if comparable results are to be obtained the accurate standardization of exercise and respiratory tests is essential if the determination of myocardial efficiency is to be reliable. By means of an instrument termed the flarimeter, which is described, the relative values of vital capacity, breath holding ability, systolic and diastolic blood pressure, heart rate, and stroke volume can be observed and comparisons can be made. Moreover the series of physiological events occurring during exercise are found to be distinctly different from those taking place when instruments are used to throw strain on the heart through changes in respiration and intrathoracic pressure. The flarimeter is a portable spirometer, provided with an orifice for measuring breath holding ability at a pressure of 20 mm. Hg and an optimum rate of flow of 36 c.cm. per second, thus effecting a standardization of breath holding, the changes in systolic pressure are simultaneously noted and evidence is easily obtained of the heart's response. The patient inspires fully and then breathes out as long as possible keeping the water level in the recording tube of the flarimeter steady at the index mark. Shortening of this outbreathing period immediately following practice of the standardized two-step exercise, and its rate of return to the normal afford an indication of the circulatory fitness. It is claimed that while measurement of the vital capacity is an important physiological index, the duration of such standardized outbreathing correlated with the accompanying systolic changes, is of higher diagnostic and prognostic value.

367. Incidence of Chronic Polyarthritis

P. BORGBJAERG (*Ugeskrift for Laeger*, September 18th, 1930, p. 893) has checked by a statistical analysis the opinion he has lately heard expressed in various quarters that the chronic medical ailments of the joints are becoming more common, whereas the cases of acute arthritis tend to become less rather than more numerous. His material consisted of the patients admitted to the two medical departments of the Bispebjerg Hospital in Copenhagen during the years 1914 to 1928 inclusive, the table he publishes gives the statistics for each of these years. In 1914 there was a total of 2,252 patients, among whom there were 28 suffering from primary progressive chronic polyarthritis, or chronic and subacute rheumatic polyarthritis, a ratio of 1.2 per cent. In the same year there were 30 patients suffering from acute rheumatic polyarthritis, a ratio of 1.3 per cent. In 1928 there was a total of 4,144 patients, among whom there were 125 suffering from primary progressive chronic polyarthritis, or chronic and subacute rheumatic polyarthritis, a ratio of 3.2 per cent. In the same year there were 52 patients suffering from acute rheumatic polyarthritis, a ratio of 1.2 per cent. The classification of this material having been in the hands of one and the same person in the period under review, uniformity in this respect was assured. It would seem that, while the incidence of acute rheumatic polyarthritis has diminished slightly in Denmark since 1914, that of the chronic forms of polyarthritis has been more than doubled.

368. Ocular Complications of Vaccinia.

P. TOULANT (*Paris Méd.*, September 6th, 1930, p. 190) concludes that vaccinal lesions due to accidental inoculation of the eyeball or the lids are uncommon, since he has been able to collect only about 100 cases, but may be very serious. As a rule, the vaccinal pustule is situated on the lid and occasionally on the conjunctiva. In 27 cases the cornea was involved. The affection is commonest in doctors and midwives and occurs sometimes in those employed in laboratories where vaccine pulp is manipulated. Less frequently ocular lesions are found in a recently vaccinated child or its parents. The inoculation sometimes follows a very superficial wound such as that caused by a fragment of ivory (Critchett) or a vaccino-style (Morax) and often is brought about by a fragment of the glass tube containing the lymph. A wound however is not necessary, and the lesion may result merely from the lymph being projected on to the cornea or conjunctiva. The symptoms vary according as the lesions are located on the lids, the conjunctiva or the cornea, the last situation being much the more serious. Vaccinal keratitis, which may be primary or secondary to a conjunctival or palpebral lesion, persists for some months to a year, and may leave opacities and synechiae. Sometimes it may give rise to perforation of the cornea and destruction of the eye. Among the 27 cases on record vaccination caused loss of both eyes in one instance and complete loss of one eye in five; in one instance enucleation was necessitated by symptoms of glaucoma and in six cases the vision was considerably reduced. Prophylaxis is very important. The patient and family should be warned of the dangers of accidental inoculation of the eye. If the conjunctiva or cornea is infected the treatment should be that of ophthalmia neonatorum.

369. Multiple Gangrenous Diphtherial Dermatitis

H. BRUDZET and O. CHRTEFFEDDIN (*Derm. Woch.*, August 30th, 1930, p. 1303) record the following case. A girl, aged 3½ years, whose brother had recently died of diphtheria, developed blepharitis and keratitis of the left eye followed twenty days later by a similar involvement of the right eye. A few days afterwards a serious discharge from the nose occurred and gangrenous ulcers appeared on the lips, back of the neck, the right axilla, both groins, and right index finger. There was marked cachexia. Cultures of the nasal mucous membrane and ulcers of the lips and skin, showed the presence of typical diphtheria bacilli. Recovery ensued after the injection of antitoxin.

370. Association of the Syndromes of Basedow and Mikulicz.

J. M. ESTAPÉ (*Per. Sud. Amer. de Méd. et de Chir.*, July, 1930, p. 721) describes the case of a Uruguayan woman, aged 25, who had had rubeola and influenza, but no other disease. A shock was followed three years later by insomnia, restlessness, anorexia with progressive emaciation, and alternating diarrhoea and constipation. She had noticed the increasing prominence of her eyes and pupillary dilatation preceded by swelling of the parotid, submaxillary, sublingual, and lacrymal glands, without fever or other functional disturbance. All these glands were found to be greatly enlarged, firm, elastic, and non-adherent. The patient had a large diffuse goitre and all the classical symptoms of Graves's disease. The nervous instability and insomnia were followed by anxiety, psychoneurosis, and melancholia, aggravated at the menstrual periods. No evidence of any other organic disease could be detected, and the Wassermann reaction was negative. General hygienic treatment with irradiation of the goitre appeared to cure the Graves's disease, but it had no effect on the hypertrophy of the salivary and lacrymal glands.

Surgery.

371. Operative Measures in Chronic Infectious Arthritis.

THE more successful treatments of chronic infectious arthritis are directed to increasing the circulation of the joint, the temperature, and thus the metabolism of the joint, and oxidation of articular tissue. Resection of sympathetic ganglions and trunks was instituted by Rowntree and Adson in the hope that this might produce an optimal degree of articular circulation in certain joints at least. The technique and results in the first 17 cases have already been described, and now P. S. HENCH, M. S. HENDERSON, L. G. ROWNTREE, and A. W. ADSON (*Journ. Lab. and Clin. Med.*, September 1930, p. 1247) give a survey of the subject. The general principle of this operation is to cut and remove the sympathetic ganglia and their rami that contain vaso-constrictor fibres to the vessels of the extremities thereby increasing the circulation and temperature of the joints of the extremities, and probably increasing tissue oxidation in them. The operation is limited to cases of chronic infections (atrophic proliferative, rheumatoid and periarticular) arthritis, and is indicated only in certain selected cases. Six major criteria for the operation are as follows: (1) The arthritis should be chiefly periarticular or synovial, with little, if any, bony alterations. (2) Some alterations in vasomotor tonus should be shown objectively. (3) Vasomotor alterations must be capable of correction or over-correction by the release of the sympathetic control; this can be demonstrated by determining the vasomotor index. (4) The patient

should be less than 35 and not more than 45 years old (5) The arthritis should be progressive and confined to the extremities, particularly the hands and feet (6) A reasonable period of intensive, less radical treatment should be allowed before this operation is considered A modification by Adson of the original technique is described The physiological sequels of the operation are all beneficial, if one views as justifiable consequences the Horner syndrome, the dryness of the skin, and absence of sweating These effects are—marked vaso dilatation, definite increase of temperature of the extremities, abolition of reflex sweating, loss of pilomotor reflex, the reaction of cardiac acceleration not markedly disturbed, and some minor atrophy of the shoulder muscles after cervico thoracic operations, but no objective muscular atrophy of the lower extremities after the lumbar operation Supplementary treatment in the form of careful massage, muscular training, and exercises should be given when indicated The authors believe that this operation is justified in the selected cases described above if used properly and not delayed too long

372 Living Suture Operations in Abdominal Hernias

W E GALLIE and A B LE MESURIER (*Canadian Med Assoc Journ*, August, 1930, p 165) described in 1921 an operation for bad abdominal hernias, in which the use of sutures made from strips of fascia lata was recommended The results after this lapse of ten years are now reviewed All the methods in general use depend upon scar tissue and are attended with a high percentage of failures The present operation, based on the well known fact that fascia lata continues to live practically unchanged after transplantation, was intended to overcome this particular fault Very good results have been obtained, and in a series of nearly 200 operations there have been only six known failures, the causes of which are discussed The most spectacular case was that of a soldier who had lost his right rectus muscle and had a ventral hernia the size of half a football The gap between the edges of the hernial ring was so wide that it could not be closed, and a space of nearly an inch was filled with fascial sutures This man, nine years after operation, is performing moderately heavy labouring work without any sign of recurrence In large ventral hernias the risk of serious complications is undoubtedly lessened if opening the peritoneum and handling the intestines can be avoided The technique of closing the opening in ventral and inguinal hernias is the same as that originally described The Mayo operation suffices for small ventral hernias or for long slits where the edges can be approximated without much tension, but for wide hernias the fascial method is advocated In oblique inguinal hernias these sutures are usually unnecessary, though it is wise to adopt McArthur's suggestion of suturing the internal oblique and conjoint tendon to Poupart's ligament behind the cord by a narrow strip split off from the external oblique aponeurosis In direct hernias and in large oblique hernias in patients nearing middle life a plentiful introduction of fascia lata should be employed The success of the living suture operation depends on the muscles and aponeuroses in the ring being left strong enough to withstand considerable strain, and on the strength and permanence of the fascial suture The authors believe that this method almost completely removes the element of chance which attends operations for hernia, and also greatly enlarges the field in which it is indicated

373 Treatment of Congenital Dislocation of the Hip

MANIPULATIVE treatment of congenital dislocation of the hip is considered difficult or practically impossible after the age of 8 to 10 when the condition is unilateral dislocation, and after the age of 4 to 6 when it is bilateral L BAU (*Chir d Org di Movimento*, August, 1930, p 266) reports the result obtained in 36 cases (13 bilateral and 23 unilateral) of old dislocations in patients between the ages of 8 and 14 Manipulative treatment by the Paci Lorenz method, with suitable modifications for each individual patient, was attempted in all cases The results obtained were 22 reductions (61 1 per cent), 11 transpositions (30 4 per cent), and 3 unsuccessful cases (8 5 per cent) Normally a preparatory period was necessary before obtaining the reduction, after which the limb was fixed gradually in a determined degree of abduction and rotation as to ensure stability of reduction and the possibility of gradual walking Mobilization was started generally in the eighth month, and walking was not permitted for another four months Kinesitherapy was successfully associated with nocturnal traction by means of weights During the first attempts at walking the patient was protected by perfectly adaptable pelvic belts, modelled with a depression to maintain the trochanter in an arrested position, at the same time enabling the limb to move in a correct position Difficulty was sometimes experienced in the form of subsequent rigidity, which rendered walking defective, although the limb remained in the correct attitude In all these cases the author was able to ensure the gradual disappearance of the rigidity after prolonged physical treatment, continuous or nocturnal traction, and gradual mobilization, sometimes under narcosis He gives details of 14 cases, and illustrates them by radiograms

374 Surgical Treatment of Incontinence of Urine in the Male

After reviewing the previous methods of treatment of incontinence of urine in men J BIDRNA (*Bratislavské Lékařské Listy*, August, 1930, p 435) describes his own method of operation which was successfully applied in the case of a man, aged 20, suffering from incontinence as a result of an operation for the removal of a urethral calculus Through a perineal incision the urethral part of the membrane was exposed in the region of the external sphincter The sphincter was substituted by a strip of fascia lata, which was applied round the urethra and served as a sling By suturing the margins of the levator ani to the posterior surface of the bulbo cavernous muscle, the urethra was raised and approached the symphysis pubis Incontinence ceased immediately after the operation, and seven months later the patient was still well The operation combines the two principles of the other previous methods—namely, the production of an annular stricture of the urethra and the artificial flexion of this passage

Therapeutics.

375 Pituitary Therapy in Herpes Zoster

D M SIDLICK (*Arch Derm and Syph*, July, 1930, p 91), from observations in 54 cases, advocates the use of pituitary extract in herpes zoster, particularly for the relief of pain Intramuscular injections of the ordinary preparation used for obstetrical cases were given in from 0 5 to 1 c cm doses, and repeated according to the intensity of the pain In most instances complete relief followed two injections given a day apart, and mild cases only required one treatment, some, however, needed three doses, and one patient received six The effectiveness of this remedy as regards the lesions was only secondary to that noted in respect of the pain, the eruption eventually disappearing entirely Pregnancy is said to be the only contraindication, and the sole untoward effect was a momentary sensation of faintness occasionally observed, the method was found to be safe in the presence of hypertension or advanced age The author considers that the treatment has many advantages over other accepted methods, especially in the control of pain

376 Stramonium in Parkinsonism

E D HOLDEMAKER and M A. BURNS (*Journ Amer Med Assoc*, July 12th, 1930, p 91) administered tincture of stramonium in large doses to 31 patients, four of whom had typical paralysis agitans They received doses of the tincture up to 60 minims three times daily, but the results were poor Ptyalorrhœa was relieved, and one patient felt slightly more relaxed Higher doses than 60 minims caused mouth dryness and anorexia Twenty seven patients were of the post encephalitic type of Parkinsonism, nine being women whose ages ranged from 20 to 43, and eighteen men whose ages were between 20 and 70 There was no definite relation between the length of illness and the improvement following treatment, but the most severe cases showed least response In eleven cases there were excellent results diminution of rigidity, surprising recovery of associated movements, complete relief of ptyalorrhœa, and definite improvement in the mental condition Five patients showed relief of ptyalorrhœa, diminished rigidity, and some return of associated movements All experienced relaxation, and were able to perform actions impossible prior to the treatment Five other patients were relieved of salivation and felt better, but their associated movements remained very defective In the last group six patients were relieved of ptyalorrhœa, but otherwise showed no improvement One woman, aged 28, had been ill for five years and bed ridden for one year, she became able to sew and to play the piano after treatment One man, aged 31, who had been ill for seven years, received 90 minims three times a day, and was then able to return to work as a night watchman Eight patients who could hardly walk, and could not dress nor feed themselves, their gait and posture being typically Parkinsonian, experienced great relief of their rigidity in consequence of treatment, their posture became more erect, and two or three appeared to be almost normal All were able to perform rapid and fine movements and to help in the wards Of the remaining fifteen post encephalitic patients, all but six were so much relieved that they could feed themselves Tremors were greatly relieved in three patients, but the remaining twenty four showed but little improvement, though rigidity was diminished Ptyalorrhœa was

greatly reduced in all cases The mental state was definitely improved in twenty one instances, coincidently with the physical improvement The average dosage for the whole series was for men 80 minims, and for women 72 minims, three times daily The largest dose given continuously was 110 minims and the smallest 45 minims Generally, the younger patients showed greater tolerance, and men were more tolerant than women As regards toxic effects of stramonium treatment xerostomia necessitated limitation of the dose in eighteen cases, while amblyopia occurred later than xerostomia, and disappeared in less than a day after withdrawal of the drug Vertigo occurred in five cases and anorexia in six, insomnia and pruritus each affected one patient

377 Treatment of Trypanosomiasis.

A SICÉ (*Ann de l Inst Pasteur*, August, 1930, p 221) records the results obtained following the administration of '270 Fourneau in 357 cases of human trypanosomiasis This drug, the sodium salt of acetyl para amino-ortho-oxyphenyl arsenic acid, is employed in freshly prepared 20 per cent solutions in sterilized distilled water it is not as rapidly or as easily soluble as tryparsamide It may be administered either subcutaneously or intravenously Of the cases recorded, 106 were in the first period of the disease—namely, the stage of lymphatic and blood infection without any invasion of the cerebro-spinal system—and 251 in the second period, in which the nerve centres were involved In the first group 97 and in the second 213 patients had received no other treatment, while 9 and 38 in each group respectively had been previously treated The results in the first group were 2.8 per cent had subsequent nervous sequels, 2.8 per cent died (causes unknown) and 57.5 were apparently cured The second group showed 14.3 per cent deaths (some from intercurrent maladies in the others the cause was unknown), and 51.3 prolonged if not definite improvement. If the numbers of those discontinuing treatment prematurely are deducted in each group, the percentage of cures is increased to 85 8 and 62 per cent. respectively The dosage should be carefully calculated in relation to the body weight The initial dose is 15 mg per kilo of weight, this is increased by 5 mg weekly to 30 to 35 mg, which dosage is maintained until 300 to 350 mg have been given in cases in the first period. The average duration of treatment is ten to twelve weeks In neural trypanosomiasis treatment must be continued until the cerebro-spinal fluid returns to normal. Two complications may occur during treatment—namely, vomiting, which is unimportant, and ocular troubles, which if treatment is not discontinued, may lead to amaurosis Sicé considers that '270 Fourneau is a powerful trypanocide and in the first period of infection is superior to atoxyl (a useful adjunct in certain cases) and to tryparsamide In the neural types its efficacy though not as great as that of tryparsamide especially in old advanced lesions is still very considerable, whether the drug is given alone or combined with tryparsamide the latter drug should be immediately substituted if the other appears to be losing efficacy

Anaesthetics

378. Acapnia in Post-operative Shock

TWENTY FIVE years ago Y. HENDERSON (*Journ Amer Med Assoc.*, August 23rd, 1930, p 572) advanced the hypothesis that acapnia—deficiency of CO_2 in the blood—was a factor in the depression of vitality, especially in the functions of respiration and the circulation after operation and anaesthesia Acapnia is defined as an acute condition involving disturbances and depression of various functions all of which are relieved and restored to the normal by inhalation of carbon dioxide the acapnial position of the lungs may be described as one near or below that of normal expiration a condition of prolonged deflation *The causal sequence* leading to surgical shock (with the exception of haemorrhage) and that leading through atelectasis to post operative pneumonia are closely related Both originate in acapnia, one through circulatory, the other through respiratory depression Acapnia is closely related to asphyxia or deficiency of oxygen in the tissues each disturbs the respiratory processes of the tissues, and each involves a considerable degree of the other A slight degree of acapnia may be induced by over ventilation of the lungs a more intense form capable of producing death by respiratory failure may result from excessive breathing in the first stage of incorrectly induced anaesthesia In the most severe form leading to shock the deficiency of carbon dioxide or decrease of alkali carbonates in the blood arises from a disturbance of the respiratory metabolism of the tissues and is analogous to asphyxia Inhalation of carbon dioxide effects a restoration of the alkali bicarbonates and carbon dioxide content of the blood Circulatory depression after operation and anaesthesia is due to the lowered activity of the respiratory and other nerve centres which influence skeletal muscles The result is an atonic condition of all the muscles and a decrease of muscular pressure on the tissues, which permit the blood to stagnate in the venules and decrease the venous return to the heart This depression is counteracted by the inhalation of carbon dioxide The consequent increase of muscle tone augments the venous return, and restores the volume of the circulation After every major operation the volume of the air breathed is decreased, and a prolonged loss of tone also occurs, with relaxation in the thoracic muscles and diaphragm The thoracic capacity is thus greatly decreased, the lungs are correspondingly deflated, and occlusion of pulmonary airways readily develops The air in the occluded lobules, lobe or lung is then absorbed and atelectasis is produced The inhalation of carbon dioxide, by counteracting acapnia and inducing deeper breathing inflates the lungs and prevents atelectasis it is thus a specific preventive of post operative pulmonary complications

379 Intradural Caudal Anaesthesia in Urethral Stricture.

C T SPENCER (*Urol and Cut Rev*, August, 1930, p 527) records four illustrative cases of stricture in men aged from 37 to 74 treated by intradural caudal anaesthesia, the advantages of which are its low toxicity and the complete relaxation of the voluntary muscles produced On the other hand, its great disadvantage is the vascular depression which it causes when the splanchnic nerves are blocked This disadvantage, however, is overcome by using an anaesthetic of high viscosity and specific gravity such as gravocain, 0.2 c cm of which causes perfect anaesthesia Caudal anaesthesia is almost invariably complete within less than five minutes after injection, and lasts for about two hours Spencer has also found intradural caudal anaesthesia very satisfactory as a preliminary to cystoscopy, or the instrumentation of patients with prostatism, fibrosis of the vesical neck, and small irritable bladders

380 Spinal Anaesthesia.

H KOSTER and M WEINTROB (*Amer Journ Surg*, August 1930, p 234) describe their personal experience of spinal anaesthesia and discuss the reasons for fatalities citing examples also from the literature In their own total of 6 000 general surgical cases there were only six deaths on the operating table three others occurred later and were regarded as possibly due to the anaesthesia. Exact statistical comparison with a similar number of cases under inhalation or other forms of anaesthesia is impossible, since no parallel control series is available, but the authors point to the large number of cases successfully operated upon for whom any other form of anaesthesia would have been disastrous as in intestinal obstruction with considerable toxaemia They are satisfied that the reduction in surgical mortality by the use of a method which diminishes shock and trauma, increases peristalsis, and affords an additional margin of safety outweighs any possible increase in death by direct anaesthetic mortality Emphasis is laid on the importance of maintaining the Trendelenburg position in cases of severe infection until the anaesthesia has passed off It follows, therefore that in a severe peritoneal infection where Fowler's position is necessary it is inadvisable to employ a spinal anaesthetic Certain cases reported of death following this form of anaesthesia are critically examined by the authors who show that in some cases the anaesthetic was wrongly blamed Surgical operations on the abdomen are particularly suited for spinal anaesthesia in view of the good relaxation which is afforded

Obstetrics and Gynaecology.

381 Excretion of Sexual Hormone in Gynaecological Diseases.

P SCHUSCHANIA (*Zentralbl. f Gynäk* August 2nd 1930 p 1924) gives detailed reports of estimations of the sexual hormone in the urine and faeces in two cases of juvenile metropathia haemorrhagica and in a case of post climacteric ovarian tumour with metrostaxis In one of the first cases the urinary excretion fell from an average of about 50 mouse units a day during twenty nine days preceding menstruation to *nil* during a menstrual period of four days and was about 20 units daily during a period of amenorrhoea. The third patient, a woman aged 67, in whom the menopause had occurred about nine years previously had repeated uterine haemorrhages curetting revealed polypoid, haemorrhagic, glandular endometrial hyperplasia The right ovary the size of the fist was removed and appeared histologically as a granulosa celled tumour exhibiting infiltrative properties

in some places Before the operation, when follicular tumour cells were active, very large amounts of sexual hormone were present in the urine and faeces, for example, daily averages of 65 and 120 mouse units respectively were recorded Ten weeks after operative ablation of the tumour the hormone was absent from five day samples of urine and faeces The author remarks that by this observation direct and quantitative confirmation is afforded of the suggestion of Schröder, Mayer, and others, based on histological grounds, that endometrial hyperplasia and morbid metrostaxis accompanying granulosa celled tumours of the ovary are due to the excessive production there of sexual hormone

382. Krukenberg Tumour of the Ovary

ACCORDING to A BABES and Madame PANTZ LAZARESCU (*Gynécol et Obstét*, June, 1930, p 465) the nature and origin of the Krukenberg ovarian tumour are still unsettled, and it is erroneous to regard every such tumour as secondary to a primary carcinoma of the digestive tract The true Krukenberg tumour is characterized by (1) diffuse infiltration of the ovary by neoplastic cells, (2) the finding in many of these cells of mucus disposed as in signet ring cells, and (3) polymorphism of the tumour cells, the name is wrongly applied as denoting any ovarian neoplasm secondary to cancer in the alimentary canal The reported cases of true Krukenberg tumour of the ovary in which complete necropsy investigations have been made are very few, another is here described Tumours were present in the ovaries, uterus, stomach, large and small intestine, peritoneum, and abdominal glands In the ovaries the tumour cells were widely diffused, polymorphous, and partially muciparous, without any areas of glandular disposition, the same was true of the neoplasms affecting the gastric mucosa and submucosa, the uterine mucosa, and the lymphatic glands In the peritoneal investment of the stomach, however, and of the uterus and intestines, adenocarcinomatous tissue was present in abundance, extending into the subjacent superficial layers of muscle The inference is drawn that the primary origin of a Krukenberg tumour is an aberrant islet of gland tissue in the peritoneum of the stomach or of some other region, an adenocarcinoma is formed, the metastases of which are propagated by the lymphatics, and take a less highly differentiated form, the glandular arrangement being lost but the mucigenous faculty being in parts preserved In cases of the so called primary Krukenberg tumour of the ovary a primary site, probably in the peritoneum, but possibly elsewhere, is likely to have been overlooked

383 Pupillary Reactions during Pregnancy

BELIEVING that excess of an adrenaline like substance might circulate in the blood during pregnancy, Z BERCOVITZ (*Amer Journ of Obstet and Gynecol*, June, 1930, p 767) instilled the serum from a pregnant woman into her own conjunctival sac He found that in about 75 per cent of cases the pupil showed a consequent variation, which consisted more usually in dilatation than in contraction, but sometimes merely in increased activity Two only of 98 non pregnant women showed any pupillary response to a similar procedure About 75 per cent of pregnant persons were found to respond by some pupillary change to the conjunctival application of adrenaline, which was ineffective in practically all non pregnant women In twelve men the pupil was not affected by instillation of their own serum or of adrenaline

Pathology.

384 The Schilling Blood Count

J L ROGATZ (*Amer Journ Dis Child*, July, 1930, p 70) describes the Schilling blood count as varying from the usual differential count in classifying the polymorphonuclear neutrophils into groups according to the degree of their maturity Schilling reduced Arneth's subdivisions of the neutrophil leucocytes to four groups—namely, myelocytes, juvenile cells, "stabs," and "segments" The myelocyte is round, with a pale pink granular cytoplasm when coloured by Wright's stain, and its nucleus ranges from round to oval or kidney shaped In contrast, the monocyte has a blue staining, irregular cytoplasm, with a polymorphic nucleus The juvenile cell has a sausage, bean, or S shaped nucleus, fairly smooth in outline and plump in appearance The stab cell contains a twisted and bizarre nucleus which is contracted, irregular in form, and pyknotic, the granulations being either too deeply stained or partly dissolved, leaving vacuoles in their place This cell, 2 to 3 per cent of which are found in the normal infant's blood, is considered to be a juvenile cell which has become matured without segmentation, in consequence of "degenerative inhibition of development" The essential characteristic of the segmented cell, which takes various nuclear forms, is the presence of the filaments connecting the lobules, two to five or more The basophils, eosinophils, lymphocytes, and monocytes in the differential count and the total leucocyte count complete the tabulation An increase in the juvenile and stab forms occurs at the height of an infection, with decrease of the lymphocytes and monocytes and disappearance of the eosinophils With improvement there is a receding neutrophilia diminution of the number of juvenile forms, with increase of the segment cells, lymphocytes, and monocytes. The eosinophils reappear with a final lymphocytosis indicating recovery It is held that the Schilling blood enumeration, when repeated at frequent intervals during an infection, reflects the progress of a patient and anticipates the appearance of a complication improvement, or other change in the body by twenty four hours or more

385 The Basal Metabolic Rate

ACCORDING some salient facts as guides in the study of basal metabolism, I M RABINOWITCH (*Canadian Med Assoc Journ*, August, 1930, p 152) defines metabolism as the chemical and physical changes which occur in the living cell, when metabolism is at its lowest possible level, with the individual alive and normal, the condition is known as basal metabolism Various methods of estimating basal metabolism are described When this is to be measured directly by heat production the subject is placed in a closed chamber known as a calorimeter Indirect methods consist in measuring the oxygen consumption alone, the carbon dioxide production alone, or both simultaneously As in all quantitative work, standards are necessary by which to estimate the results and to determine whether and by how much basal metabolism is above or below the normal The author has obtained the most uniform results by using an average of both the Sage and the Harris Benedict methods He emphasizes the point that with the use of any particular standard alone the value reported may be 5 or more per cent above or below true conditions, and that this variable is the rule and not the exception Contrary to the general impression that the basal metabolism of an individual is extremely constant, in certain types of persons there are not only seasonal, but also daily and even hourly variations, these are not the result of technical error Muscular activity increases the metabolic rate, as also does fever, for every 1° F above normal 7 per cent should be subtracted from the test results Diet influences metabolism, and protein, more than any other food, raises the rate According to Lusk the nutritional condition of the body, and not a large influx of food, determines the height of metabolism Nervous factors affect the rate, anxiety and loss of sleep raise it, while in the opposite conditions the basal metabolism is more likely to be decreased Increased basal metabolism is found during menstruation, the later months of pregnancy, and lactation At the menopause the metabolism tends to be low Heart disease *per se* does not increase the basal metabolic rate, increases are noted, but are usually due either to increased respiratory effort (muscular work) on account of shortness of breath in heart failure, or an apparent increase because of cyanosis

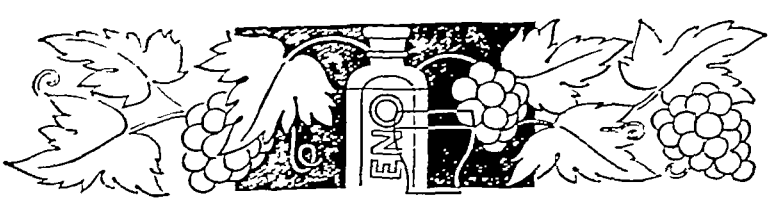
386 Allergy in Urticaria due to Cold

J S COVISA and J GAY PRIETO (*Derm Woch*, August 9th 1930, p 1188) record two cases of urticaria due to cold, one in a child 2½ years old and the other in a man aged 26 In each case the following investigations were performed A specimen of blood serum was collected while the patient was apparently normal, an artificial urticarial rash was then induced by applying ice to the trunk, and a further specimen of blood serum was obtained Samples of these two serums (0 1 c cm) were injected intradermally into two volunteers, control serum being obtained from a patient with cutaneous epithelioma At intervals of ten, twenty, and thirty minutes after each injection the diameter of the resultant papule was measured The most intense reaction was obtained at the site of injection of the patient's serum taken after the artificial urticaria After twenty four hours cold was applied to each injection site to test the degree of transmission of sensitivity, only the sites of injection of the patient's serum taken before the artificial urticaria showed any change On the assumption of Doerr's theory of allergy the authors suggest the following explanation of these results The serum of the hypersensitive patient contains substances (antibodies) which can be transmitted to a healthy person Cold provokes the formation of another substance (playing the part of an antigen), which is demonstrable in the patient's serum after an urticarial attack This substance neutralizes the antibodies, and in doing so brings about the allergic reaction After some time the antigen like substance disappears, and the antibodies are once more demonstrable

REGULARITY AND COMPLETENESS OF BOWEL EVACUATION

HOW TO ENSURE BOTH

Attention has recently been drawn to the incompleteness of evacuation common even among those who complacently boast of their regularity



Completeness as a distinguished physician said the other day is "*even more important than regularity*" in the exercise of this physiological function Incomplete evacuation doubtless explains why so many people with regular once a-day habits, continue to suffer from headache lassitude, nausea, and all those other symptoms customarily attributed to alimentary toxaemia The truth is that, in these individuals, the rectal neuromuscular tension scarcely ever recovers normality

These discomforts and disabilities can generally be made rapidly to disappear by a *minimal, effective* dose of Eno's Fruit Salt, taken each morning before the early *cup of tea* Eno *is* a carefully prepared saline laxative of fine granular consistency, instantly soluble in water with effervescence It is entirely free from the nauseous and irritating mineral salts Its pleasant taste and refreshing character are due to its chemical purity and physical texture Another of its advantages is that it contains no sugar or artificial flavouring agent.

'The Doctor's Emergency Reminder'

The Proprietors of ENO's Fruit Salt" will deem it a privilege to send to any member of the Medical Profession a copy of the latest of their series of Medical Reminders —with or without a bottle of their preparation as desired "The Doctor's Emergency Reminder" summarises briefly a few points in connection with the treatment of poisoning and various other emergency cases. It is bound in black morocco limp to conform to the style of the previous publications in this series

J C ENO, LTD., 160, Piccadilly, London, W 1

ENO'S 'FRUIT SALT"

Your patients' UNDERWEAR

There must be many times when patients consult you on the question of hygienic clothing.

There are soft Wolsey garments in every weight you would want to advise The value of pure wool underwear, which clothes the body lightly but warmly we do not need to elaborate But we may emphasise that in suggesting Wolsey you are recommending a brand of underwear with thirty years reputation

WOLSEY LTD., LEICESTER

WOLSEY *underwear*

for women, men and children

FOR DEAFNESS

Doctors prefer "ARDENTE" because—

1 It is individually fitted to suit the case for young middle aged or old
2. It is simple and true to-tone, and leaves the hands free
3. It removes strain, thus relieving head noises, giving inconspicuous hearing
4 It conveys sounds from varying ranges and angles
5 It is entirely different, uncopyable, and carries a guarantee and service system
6 It is suitable for "hard of hearing" or acutely deaf through various causes.
7 It is helpful for conversation, music, talkies, wireless home, office, public work, and sports

FREE HOME TESTS
arranged for Doctors and Patients
Medical Prescriptions made up to the minutest detail

"ARDENTE" STETHOSCOPE
Mr J H Dent makes a Stethoscope specially for members of the medical profession suffering from deafness Many are in use and excellent results are reported on the latest as evidenced by the interest shown at the last B M A Meeting

MEDICAL REPORTS
Commended by all leading medical journals—Mr Dent will be happy to send full particulars and reprints on request

Modernity and Elastic Hosiery

Illustration No 1 is a reproduction of a photograph of a lady wearing a Salt's dress silk knee stocking (including foot piece) on the right leg

Illustration No 2 is a reproduction of a photograph from the back with ordinary silk stocking pulled up. (The right leg only has the elastic stocking underneath the silk hose)

In the present age when strenuous exercise—especially dancing—is so prevalent the danger of discarding elastic hosiery is obvious to Medical Men In order to prevent this risk we have produced our famous

"DRESS SILK" HOSIERY

which is inconspicuous when worn under the fashionable silk stockings of to day

---

Medical Men are invited to note the two untouched photographs appended which fail to show any difference in the two legs

---

N B Our special Dress Silk Stocking which is made from the finest China Silk with rubber strands is naturally more expensive and is not suitable for rough usage

---

We supply however 10 qualities of Elastic Hosiery in 8 different colours to meet the requirements of all classes of patients

STANIFORM

Regd. BRAND Trade Mark

METHYL STANNIC IODIDE

OINTMENT
Immediately stops the pain in all cases of burns scalds etc

DUSTING POWDER
For application where a greasy substance is counter indicated

LINIMENT
Remarkably effective in treatment of Rheumatoid Arthritis

LOTION
A panacea for Mosquito and other insect bites Most effective for all purposes where Tr Iodine is employed Does not stain the skin and there is no sting

TABLETS
Staniform being an organic compound is more easily assimilated than the Tin preparations at present in use

Supplies may be obtained through the Wholesale Druggists Druggists Sundriesmen or Dental Supply Companies

What the Profession says

The following are some recent unsolicited testimonials reported to the Manufacturers by Medical Men

I have treated with Staniform' a very bad scald of chest in a child who had boiling water spilt over her It healed completely in fourteen days with out a scar

I have tried 'Staniform' in the Out patients Department and both Mr Staff and myself were amazed at results obtained Long standing sinus and skin wounds healed after few applications

This is to certify that Staniform has been used with great success in the Emma Klinick (Utrecht, Holland), in cases of bed sores, in burns of heat and X rays

Similar testimony has been received from a large number of medical men when Staniform has been used for the treatment of Burns Wounds and Skin Ailments

STANIFORM is used in Leading Hospitals

STANIFORM over a wide field of clinical experience has exhibited peculiar curative properties Combining the well known usefulness of Tin in staphylococcic infections with the powerful germicidal properties of Iodine Staniform is indicated generally in local inflammations, inducing an immediate soothing effect with rapid healing

Compri-Vena

NON-RUBBER STOCKINGS *for* VARICOSE VEINS

give uniform and efficient support without any constriction.

All Compri-Vena stockings are made according to individual requirements and measurements, contain no rubber, and owing to the special method of weaving based on scientific principles, give firm support in absolute comfort. They are washable and invisible even under the finest silk hose.

By means of a chemical restorative used after washing Compri-Vena stockings maintain their perfect fit and supportive qualities throughout long and constant wear. Compri-Vena stockings have for years had the recommendation of the Medical Profession.

Further particulars, testimonials, or personal demonstration on request.

THE NATION HAS CHOSEN

The nation has chosen *Gas for to day Gas for the future* Here is proof In the British Isles to day there are nearly 10,000,000 gas consumers Practically every family in an area of gas supply is *using* gas And now, wherever an up-to date housing scheme is in progress, there you will find gas

Take London, for instance In one great housing scheme 18,000 houses are completed Every one has a gas cooker, gas fire, and gas lighting fittings

In another estate are 4,000 houses All have gas for cooking and heating All have a gas lighting point Many have gas coppers

In 1929 one London gas company alone equipped over 20,000 new houses with 115,000 gas points for cookers, fires, wash coppers, water heaters, lighting fittings

In nine new estates in this company's area there are over 5,000 houses and over 500 flats All are having gas for water heating

Turn to the provinces What of their new houses Here are a few examples 33,000 out of 34,000 new houses built in Glasgow have gas cookers, fires, and wash coppers

Nearly all of the 20,000 new houses erected in Liverpool have gas cookers and coppers, and between them use some 40,000 gas fires

Come south to Surrey In several housing schemes there is a total of 2,900 houses Over 2 800 are using gas for cooking, heating, and water heating. Many have gas lighting

Are not these figures proof that gas is fast becoming the foremost fuel for every domestic purpose?

GAS
for all purposes

The B C G A, representing the British Gas Industry, is at your service for free advice and help on any use of gas

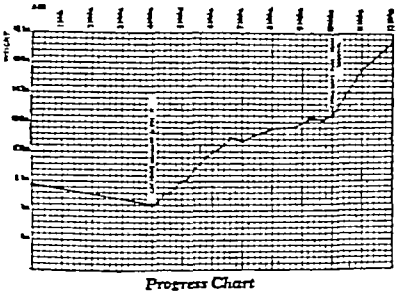
A "RESURRECTION"

GUILDFORD
30 6/30



"Baby Hook, came under my care shortly after birth suffering with marasmus following whooping cough Broncho-pneumonia developed and was with great difficulty cleared up, leaving the child in a very low condition. Feeding proved a difficult problem, several things were tried without beneficial results The results with Cow & Gate were truly wonderful, indeed it is a case of 'a resurrection.'"

(Signed)..... M.B Ch B

Lacidac (separated) and Brestol, the Cow & Gate Humanised Cream, were used in the early days of treatment. Cow & Gate Full Cream and Brestol being used subsequently.

BEFORE—4 months' old, 6 lbs. 9 ozs. in weight.

Progress Chart

AFTER—10 months' old, 12 lbs. 6 ozs. in weight.

June 1930 Baby Hook has now won a prize in a Baby Competition!

Write for literature and clinical samples of Lacidac and Brestol.

The Answer to the "first Question"

INVARIABLY before prescribing for any ailment, the first question the physician asks the patient concerns the function of the bowels

He then naturally asks himself what corrective, if any, to prescribe to suit the condition, without interfering with the treatment

Agarol provides a safe answer to this

Agarol Brand Compound the original mineral oil and agar-agar emulsion with phenolphthalein, is free from any artificial flavouring, sugar, alkali or alcohol It is safe in diabetes, in gastric diseases, for children as well as adults No excess of mineral oil to interfere with digestion or to cause leakage

In addition, *gentle stimulation* of peristalsis, makes the result certain and the re-establishment of regular habits possible.

One tablespoonful at bedtime —is the adult dose

Final decision on the true worth of Agarol Brand Compound rests with the physician. We will gladly send a liberal quantity with literature, for trial

AGAROL BRAND COMPOUND *for Constipation*

FRANCIS NEWBERY & SONS, LTD., 31-33, Banner Street, London, E C 1.

Prepared by WILLIAM R. WARNER & CO, INC, *Manufacturing Pharmacists Since 1856*

Printed and published by the Medical Association, at their Office, Tavistock Square, in the Parish of St Pancras, in the County of London

BAILLIÈRE, TINDALL & COX, 7 & 8, Henrietta St, London, W C 2

WHEN YOU PRESCRIBE WARMTH WITH FRESH AIR

All medical men will agree that the practice of heaping thick, stuffy fabrics on the body to keep out the cold is merely increasing the risk of winter chills and influenza The skin needs ventilation—the impurities in the air round the body must be allowed to escape Fresh air must have access. Perspiration must be absorbed That is why Jaeger underwear, made of pure Jaeger wool, is so often recommended as the healthiest underwear for all seasons All Jaeger underwear is treated against shrinkage And there are Jaeger Agents in every town

YOU RECOMMEND JAEGER PURE WOOL UNDERWEAR!

A really remarkable achievement!

THE KOMPAK MODEL

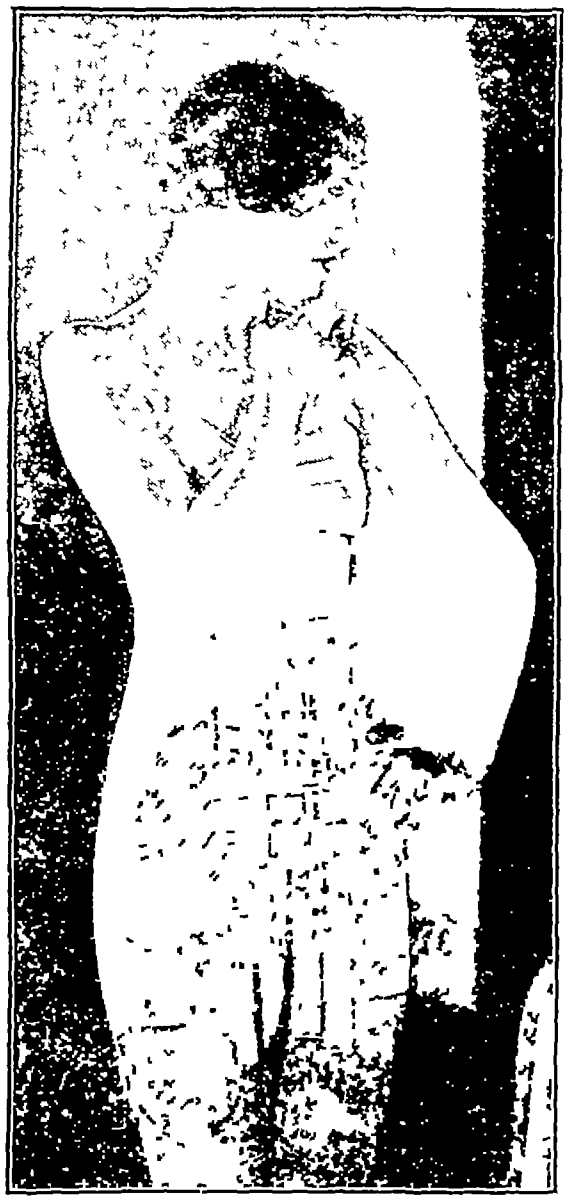
SMALLEST . . . LIGHTEST HANDIEST

SCIENTIFIC ACCURACY *"in a camera case"*

Lifetime Baumanometer
STANDARD FOR BLOODPRESSURE

The result of years of specialized effort to produce a more compact instrument without sacrificing the absolute accuracy which our Medical Profession demands, and which they have always found in the Baumanometer

Compactly encased in Duralumin — inlaid with genuine, Morocco grain leather, weighing only thirty ounces — the Kompak model is not only lighter and more durable, but smaller in every dimension And it has our lifetime guarantee against breakage and the absolute accuracy guaranteed to all Baumanometers



For accuracy, portability, and simple beauty, the Kompak Model will undoubtedly commend itself to the Meaical Profession Not only does it contain all the improvements pioneered by the original Baumanometer (of which more than one hundred thousand are now in use) but many others which you cannot begin to appreciate until you see them

Now on display at leading Surgical Equipment Houses, or at

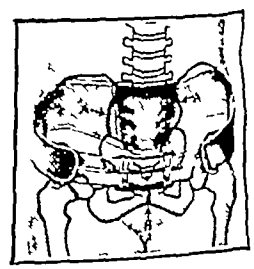
HAWKSLEY & SONS, LTD, 83, Wigmore Street, LONDON, W 1



For the Relief of Sacro-iliac Relaxation or Strain.

WHEN a sacro-iliac lesion has been caused by heavy lifting, child-birth, bad posture or other conditions, a Spencer Belt relieves the condition by immobilizing the articulations involved

Fixation of the sacro-iliac joints is achieved by means of a Spencer specially designed belt or corset whose inner band, fitted with a pad, acts as a fulcrum in securing proper adjustment.

The sacro-iliac band which is built inside the corset or belt can be adjusted as tightly as necessary from the outside after the belt or corset is in place. Since the band is built into the Spencer Support, it never rides out of position It holds the bony structure in position, thus relieving tension or pressure and hastening the return to normal condition Each Spencer Support is especially designed for the patient who is to wear it. The Spencer Corsetiere in your town will call at your Surgery or at your patient's home to take measurements under your supervision Look in the telephone book under "Spencer Corsetière", if you do not find her listed write direct to us Spencer Supports and Corsets are never sold in shops

The shadowgraph above shews the position in which the special inner belt is applied to the body This is not a complete garment worn by itself but a part of a Spencer Sacro-iliac Corset or Belt which holds it in position

FACTS & FIGURES . . . . . .

Relating to the latest progress in Actinotherapy

. . . an authoritative collection for free distribution to the Medical Profession.

AS a general tonic treatment, as a specific in rickets, and as a curative means in certain forms of tuberculosis, anæmia, etc.—actinotherapy is regarded as a most valuable addition to the armoury of present day medicine by an ever increasing number of the most highly qualified men Difficulty, however is often experienced in obtaining up-to date information of the latest developments in this field—facts and figures relating to recent successes in this country and elsewhere

It is not unnatural that the Hanovia Company who have specialised exclusively in the manufacture of actinotherapy equipment for over 25 years and have supplied over 167,000 Quartz Lamps for medical purposes in all parts of the world, should possess a most complete record of all such progress

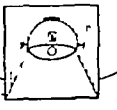
In the Hanovia Company you have a clearing house an authoritative collection of all available facts ready to supply your needs, if you are interested in or practising actinotherapy

From whatever point of view you may be interested Hanovia can supply you with the fullest information You place yourself under no obligation whatever by writing to the address below, stating what special branch of work is most likely to interest you

THE VARIOUS MODELS OF HANOVIA QUARTZ LAMPS

FOR ACTINOTHERAPY

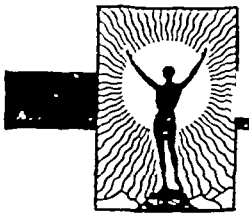
HANOVIA ALPINE SUN for general radiation Administered to individual patients lying or standing



THE KROMAYER LAMP for local or artificial treatment

JESIONEK QUARTZ LAMP for the treatment of groups of patients, in hospitals, clinics, etc.

THE PORTABLE HOMESUN LAMP for use in hospital wards or the patient's home where roborant treatment is indicated
This lamp is intended only for tonic purposes



FOR LUMINOUS HEAT THERAPY

THE SOLLUX LAMPS for luminous heat therapy Also frequently used in conjunction with Hanovia Quartz Lamps

WRITE TODAY FOR DETAILS OF THE HANOVIA REPRINT SERVICE

Hanovia data is divided under the following heads —General Practice General Surgery, Public Health Work Tuberculosis Pediatrics Dermatology Gynæcology, Oto Laryngology etc., etc. Over one hundred reprints of these and other subjects are available for free distribution to the Medical Profession A full list of these will be sent to you together with copies under any heading of special interest to you Write for this list to day Mark the enquiry Dept. 9

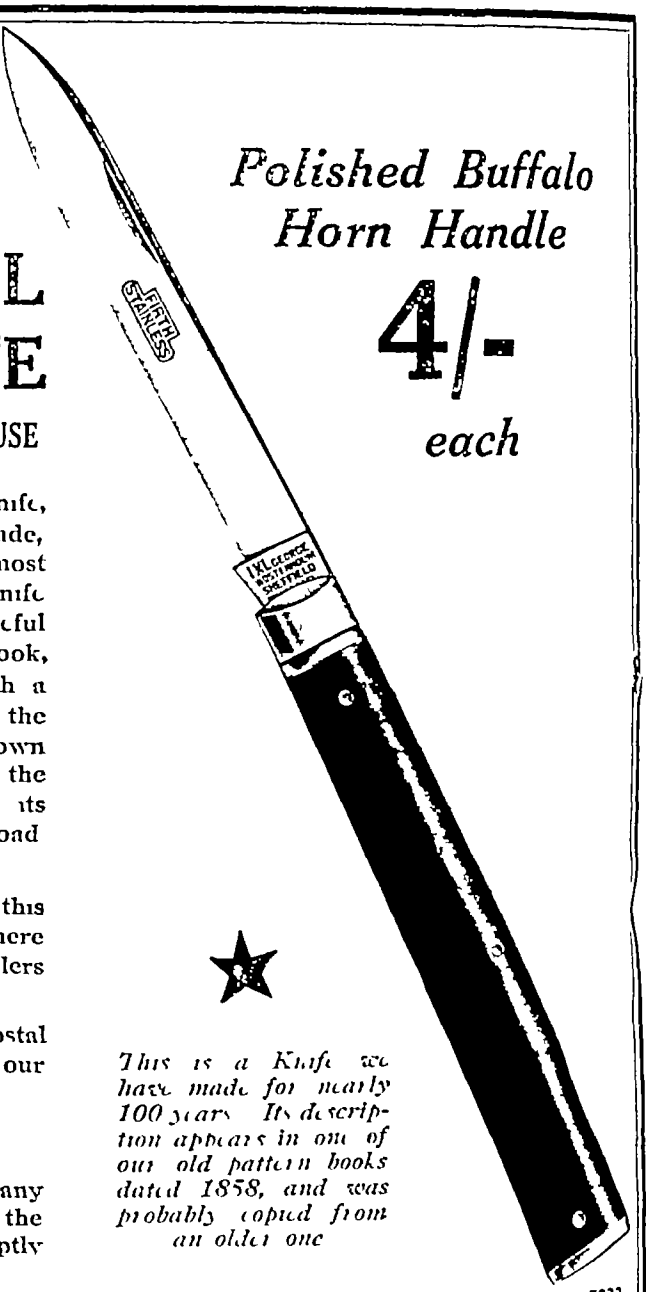
The

I·XL

STAINLESS STEEL PHYSICIAN'S KNIFE

A PLEASURE TO OWN AND DELIGHTFUL TO USE



ORIGINALLY designed for the Physician, this knife, by virtue of its long useful, highly polished blade, now made of Stainless Steel, is to day being used most extensively as a Fruit Knife—in fact, no better knife could be found for this purpose It is also most useful for opening letters, cutting the leaves of a book, sharpening pencils, and many more purposes which a good knife can serve The Nickel Silver cap on the end can be used on sealing wax, or for pressing down tobacco in the pipe The Physician will still find the long blade of this knife extremely useful for its original purpose—that of taking powder from broad necked bottles

There is an I XL stockist in every district, but as this is a knife designed mainly for Physicians, and there is not a large sale, we are not asking our dealers to stock it.

If you wish for one of the Knives, send us Postal Order for 4/, and we will send it to you through our local dealer

OUR GUARANTEE.

We are sure you will like the Knife, but if for any reason you are not entirely satisfied, please return the Knife to us within seven days, and we will promptly refund your money in full

Polished Buffalo Horn Handle

4/-

each

This is a Knife we have made for nearly 100 years Its description appears in one of our old pattern books dated 1858, and was probably copied from an older one

Local Anæsthesia in Surgical Practice

OVARIAN CYST

Typical Case

Operation Hysterectomy Bilateral Salpingectomy, Right Oophorectomy, Appendectomy Mrs W F A, aged 44 years

Anaesthesia Local infiltration, pelvic splanchnic

Anaesthesia and Operative Technique A mid-line infiltration was made using 150 c c Novocain-Adrenaline solution, and the abdomen was opened with a 10 cm incision The cyst which presented was punctured with a large trocar By means of a suction 6,000 c c of brown opaque thick fluid was aspirated, so that the partially collapsed tumour could be drawn through the wound It was found to take origin in the right ovary, which was removed along with both tubes and the uterus, as the malignant character of the cyst was noted on examination Appendicectomy was also performed All raw surfaces were peritonized and the wound was closed without drainage

—Extract from Practical Local Anaesthesia (Farr)

(Full technique of this and one hundred other operations under Local Anaesthesia will be found in the above work published by Henry Kimpton 263 High Holborn London W C 1)

THE SAFEST LOCAL ANAESTHETIC

Ample supplies of Novocain are available for the use of Surgeons at all the chief Hospitals Specify "Novocain" for your next operation

Does not contain Cocaine and does not come under the Dangerous Drugs Act.

MEDULLA RUBRA

BONE-MARROW IN ANAEMIA FROM HAEMORRHAGE

W Borchardt (*Berl med Woch*, March 28th 1930 p 521) records the results of his experiments on young dogs in which anæmia had been artificially produced by the removal of about half their blood In the first series some of the animals were fed with rib marrow others with marrow from the long bones Control animals received a corresponding amount either of fat or of liver extract The basal diet in each case contained a sufficiency of iron (5 mg per cent) Only the animals receiving the red rib marrow showed a definite increase of weight and their haemoglobin formation was more rapid than that of the others In the next series the experiment was repeated but the iron content of the diet was reduced to 1 4 mg per cent The result was similar but more striking the dogs receiving the rib marrow regaining their haemoglobin far more quickly than the others

THIS extract from the "Epitome of Literature," published in the "BRITISH MEDICAL JOURNAL," dated May 3rd last, is important as representing, in 1930, a complete justification of the formula upon which

Roboleine
THE FOOD THAT BUILDS THE BODY

has been produced without variation during the past twenty-five years

The success of ROBOLEINE is thus due to intelligent anticipation and to consistently maintaining the highest possible standard of manufacture

Medical Practitioners are asked to satisfy themselves of the merits of ROBOLEINE, for which purpose testing samples will be gladly sent upon request.

AN IDEAL
URINARY ANTISEPTIC
IN
B. COLI INVASION

cystitis, pyelitis, gonorrhoea, prostatitis, epididymitis, cervicitis, vaginitis, etc.

Pyridium is the registered trade mark of The Pyridium Corporation of New York

PYRIDIUM—Phenyl-azo alpha-alpha-diammo-pyridine hydrochloride—displays strong antibacterial properties toward coccal bacteria and B Coli It is of special service therefore in mixed infections, and, owing to its capacity for concentration in the tissues and organs of the genito-urinary system its beneficial effects are noted, in addition to Cystitis and Pyelitis in such conditions as Prostatitis, Epididymitis, Vaginitis, Urethritis, Endometritis, etc

Pyridium is administered orally in the form of 0 1 gram tablets—2 t i d—and in its early excretion through the urine, which it colours orange to red it exercises a soothing and healing effect on the mucous membranes Pyridium has marked power of penetration which explains its success in counteracting the ravages of cocci and bacilli below the surface, and it also stimulates the proliferation of epithelial cells It is characterised by its freedom from toxic effects

Descriptive literature of Pyridium, together with sample will be gladly sent to any medical practitioner interested

Menley & James, Ltd, Hatton Garden, London

"OPOJEX" **OVARIAN RESIDUE** (B.O.C) *(Prepared in France)*
(Ovary *sine* Corpus Luteum)

Supplied in boxes of 6 ampoules of 1 c.c for intramuscular injection

A Valuable AID in MIDWIFERY

In communications from practitioners which have appeared in the medical journals from time to time, drawing attention to the advantages of employing intramuscular injections of Ovarian Residue extract in midwifery it is claimed—

That **when used as a routine in the first and second stages of labour,** injections of the extract **tend to shorten labour enormously,** and to render relaxation so complete that delivery is easy post-partum haemorrhage rarely occurring

That Ovarian Residue extract can also be successfully employed for the **induction of labour,** either at full term or earlier (at the eighth month) should the necessity arise, and that with this form of induction, in both primiparae and multiparae, the **labour produced is almost painless throughout the first and beginning of the second stage.**

The above findings have been substantially confirmed by practitioners who have employed Opojex" Ovarian Residue (B.O.C.)

Full particulars will be sent to Medical Practitioners on request

OVALTINE

FOR THE AGED

'Ovaltine is delicious sustenance for old people It sustains life ideally by giving tone to the tissues and promoting the healthy activity of the bodily functions

Ovaltine provides complete nourishment in easily assimilable form Its use greatly increases the nourishing value of other foods The digestibility of milk, for instance, so largely used in old age, is increased two-fold by adding "Ovaltine to it, while the starch in the cereals is converted into easily assimilated malt sugar by the enzyme diastase which Ovaltine contains in abundance

'Ovaltine is purin-free Its use, therefore, neither aggravates nor favours the accumulation of uric acid in the system nor leads to kidney disorder or gout. The tendency to constipation, so common in old age, is avoided by the use of Ovaltine.

Ovaltine replaces to great advantage the usual meal-time beverages tea and coffee, which are valueless as sources of nourishment and often contraindicated in senility

This treatment entirely without danger, is suitable for application by any Medical Practitioner It has yielded noteworthy results in the treatment of Cutaneous, Pulmonary and Genito-urinary Tuberculosis Tuberculous Mucous Membranes, and Tuberculous Lymphatic Glands 1 c c ampoules supplied in boxes of twelve

Sanatogen Strengthens but does not Irritate

The value of Sanatogen as a tonic food lies in its ready absorption Even the weakest stomach can easily digest Sanatogen For this reason Prof Ewald of Berlin University, amongst others, has frequently given it in typhoid fever and reports that it is promptly absorbed during the febrile period with apparently the same ease as under normal conditions

Writing in "*The Medical Press and Circular,*" a leading authority says

"*Sanatogen is readily absorbed by the stomach and has an immediate and remarkable effect, shown by a steady increase of body-weight and of muscular strength and energy.*"

GENATOSAN LTD, LOUGHBOROUGH, LEICESTERSHIRE

Builds up in underweight conditions and provides a perfectly balanced, highly nutritive diet for growing children

TO the problem of the "underweight" child Horlick's Malted Milk provides a convenient solution

For many years it has been successfully used by the medical and nursing professions for fast-growing children, for invalids, for expectant and nursing mothers — in all cases where it is particularly important to sustain strength and replenish natural energy quickly

Excellent results obtained by adding Horlick's to the diet of growing children have been strikingly recorded in many thousands of letters written by parents and members of the medical profession

Made from fresh, full-cream cows' milk, selected wheat and malted barley, Horlick's Malted Milk constitutes a perfectly balanced food — containing fat, proteids, and soluble carbohydrates in correct nutritive ratio

The vitamins of its constituents are unimpaired by the Horlick process

Horlick's contains neither cane sugar nor unaltered starch, but presents in proper proportions a sufficiency of valuable malt sugars, for which children have a greater toleration Moreover, Horlick's is partially pre-digested during manufacture, thereby assuring perfect assimilation

In addition to its important body-building qualities, Horlick's has the advantage of being an extremely palatable beverage Most children like the natural flavour of malt and will drink Horlick's with pleasure. And it is now obtainable also in a new *Chocolate Flavoured form* — identical in constituents with the original Horlick's, but with fine chocolate added.

Horlick's Malted Milk (both forms) is obtainable everywhere in sealed glass bottles, at 2/-, 3/6, 8/6 and 15/- Also in tablets

Further details and supplies for tests may be obtained from Horlick's Malted Milk Co , Ltd., Slough, Bucks

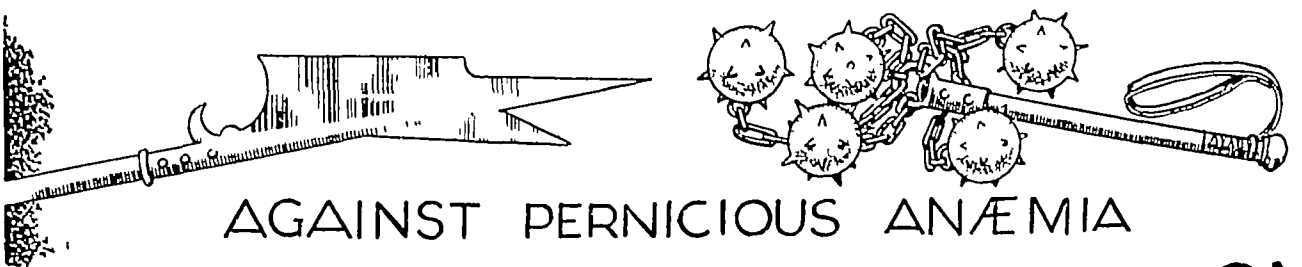
MALNUTRITION and MARASMUS

Mellin's Food has met with very remarkable success in the treatment of infants of retarded development due to nutritional disorders Infants in this condition need a food substance that is assimilated quickly and one that may be taken in comparatively large amounts

The carbohydrate maltose, which is the principal sugar in Mellin's Food, is a food substance that offers the greatest assistance in the adjustment of the diet because it yields immediately available nutrition and can be at once utilised to furnish the necessary heat and energy.

Mellin's Food



"MODIFIED MILK IN INFANT FEEDING"

The above-named booklet of 64 pages, which gives further information regarding the use of Mellin's Food in cases of malnutrition, will be gladly sent to Members of the Medical Profession

Specially indicated in

NEPHRITIS - URÆMIA - ECLAMPSIA - ALBUMINURIA

and allied conditions.

PROMPT and proper diagnosis of kidney conditions is necessary in cases of Bright's disease and all types of renal disorders. In nine cases out of ten the administration of a specific capable of producing real results in compensating for the loss of kidney function is also necessary

For more than a quarter of a century Nephritin has been a sheet anchor to physicians in treating such disorders. Nephritin Tablets induce a marked increase in nitrogenous waste elimination. They reactivate the cells of the kidney increase urinary secretion and induce a greater output of urea.

Given in sufficient dosage these tablets produce marked results and restoration to normal is quickly stimulated. They are invaluable also as a prophylactic in renal complications of infectious diseases and during pregnancy The tablets are composed of the hormones of the normal kidney as they appear in nature—*absolutely unaltered.*

SELECTIVE GERMICIDAL POWER

STREPTOCOCCUS HAEMOLYTICUS

IT is not generally recognized that antiseptics exhibit wide variations in their power of killing different bacteria Phenol, the first antiseptic ever used, affords an example of this It differentiates so markedly between the typhoid-coli group and the Gram-positive cocci that if added in the proportion of 1 in 200 to a medium inoculated with a mixture of B coli and streptococci, the former are killed and the latter multiply

Monsol, which is derived from a by-product of the Mond power-gas process differs radically from other coal-tar antiseptics in its selective action, which is the opposite of ordinary coal-tar preparations Its power of killing the STREPTOCOCCUS PYOGENES and notably the strain HAEMOLYTICUS is more than 10 times greater than that of pure phenol or of lysol

Monsol is non-irritant, and can be applied in effective dilution even to mucous membranes In view of these facts it is not surprising that Monsol has been found to have unprecedented qualities in the treatment of Streptococcal infections

Monsol can be applied to the treatment of septic conditions of the SKIN the MOUTH and THROAT and the MUCOSA and is especially indicated in Obstetrics

MONSOL BRAND

THE VICIOUS CIRCLE IN INTESTINAL COMPLICATIONS

It is probable that each putrefactive organism creates a toxin productive of some deleterious effect It is on this hypothesis that constipation is primarily ascribed to the influence of some of these poisons acting directly on the musculature of the bowel, or on the nerve cells and ganglia in its walls

However the diminished peristaltic action is caused, it is certain that it is the beginning of a vicious circle, which is completed by a deepening line of inertia, stasis, digestive toxaemia, and lowered resistance of the cells of the mucosa

To break the vicious circle, an efficient, non-toxic intestinal bactericide is clearly indicated By destroying the putrefactive organisms a further supply of toxins is cut off, and the nerve cells, released from the paralysing action of the toxins, are free to stimulate the muscles, with the result that peristalsis is re-established and the vicious circle is broken

Samples and literature will be sent on application to the

DIMOL LABORATORIES, LTD, 40, LUDGATE HILL, LONDON, E.C.4.

Lactose 73%
Dextrin 25%
. . . *in palatable combination*

Lactose 73%, dextrin 25%—that is the proportion in which these carbohydrates are combined in this new food for changing the intestinal flora Both are more slowly absorbed than other carbohydrates, and both are able to reach the colon in sufficient quantity to cause a luxuriant growth of protective flora An acid reaction of the intestinal content is unfavourable to toxic organisms is thus produced —Lacto-Dextrin being highly efficient in promoting the growth development of both B acidophilus and B bifidus in the colon This pure carbohydrate food with lactose and dextrin are presented in a palatable and

Samples and literature of both these intestinal products will be sent to members of the Medical Profession on request to Coates & Cooper, 41, Gt Tower St London E C 3, Sole Distributing Agents for the United Kingdom and Irish Free State

BRAUN, 16, Wa

LACTO-DEXTRIN

ictured by the BATTLE CREEK FOOD CO, Mich, U.S.A

PSYLLA

an accessory for use in conjunction with Lacto-Dextrin

Where bulk and lubrication of the intestinal tract is also required, the use of BATTLE CREEK Psylla (Plantago Psyllium) is invaluable as an accessory The small brown seed when in contact with water swells into a soft gelatinous mass and acts most effectively both as an emollient and intestinal evacuant

In Nasal and Bronchial Congestion Prescribe

EPHEDRINE B.D.H.

Ephedrine B.D.H is for use primarily in the treatment of conditions which are characterised by nasal or bronchial congestion—colds asthma, hay-fever and whooping-cough—for it gives prompt relief to the blocked respiratory passages On account of its pressor action Ephedrine B.D.H. is recommended also in the treatment of shock

Ephedrine B.D.H is prepared in the B.D.H. Chemical Works by a special process of extraction from the plant Ma Huang which is imported direct from China

It is an established fact that the Ephedrine thus extracted from the natural botanical source is of considerably greater physiological activity than the synthetic product *(Arch Internat de Laryngol* Feb 1930 p 234)

REGETHERM POULTICE

(Cataplasma Kaolini B P.C)

CLEAN & CONVENIENT IN USE

More certain in its action than the old-fashioned poultice.

The healing action of Regetherm Antiphlogistic Poultice is governed by its ability to prolong and maintain an even degree of heat over a length of period Moreover the ingredients are so balanced that this action does not set up any counter irritation but allays pain ensures an even circulation through the congested areas and thus induces natural and pain free rest

The Medical Profession will appreciate the fact that the action of Regetherm Poultice is much superior to that of fomentations or linseed poultices and can be relied upon as an efficient aid in the treatment of all type of inflammation—whether local and superficial or of deep seated origin

PRICE 2/- PER 1-lb. TIN

THE ENTIRE GROUP OF NITROGENOUS SUBSTANCES OF LEAN BEEF AND ENTIRE WHEAT GRAIN,

THOSE NATIVELY SOLUBLE AND THOSE RENDERED SOLUBLE BY PHYSIOLOGICAL HYDROLYSIS, AMINO-ACIDS AND POLYPEPTIDS WITH THE NATURAL SAVORY EXTRACTIVES AND MINERALS THE WHEAT CARBOHYDRATES PHYSIOLOGICALLY CONVERTED TO DEXTRIN AND MALTOSE.

All this Blended in a Calculated Ratio in a Highly Agreeable Fluid

THIS IS 'PANOPEPTON'—A DYNAMIC FOOD

In the preparation of Panopepton the beef is submitted to the action of gastric juice extract at normal temperature and acidity to a complete conversion of the proteins, the clarified solution concentrated in vacuo

The hard wheat grain, well-cooked like a cereal, is subjected to both proteolytic and amylolytic digestion by a freshly prepared pancreas gland extract at normal media and temperature, until free from coagulable protein, and free from starch, the clarified solution concentrated in vacuo The soluble concentrates of the beef and wheat are combined on the basis of assay

Thus in Panopepton is assembled this designed comprehensive variety of protein derivatives, highly diffusible, physiologically complementary, mutually helpful in nutrition, of the native wheat-berry—albumen (vegetable), glutin-casein, glutin-fibrin, gliadin, mucedin, of beef—albumen, myosin, connective tissue-protein (source of gelatin), beef extractives, creatin, creatinin, sarcin, xanthin, and inosin With the natively soluble associated principles, mineral, etc as well as these principles of the gastric and pancreatic gland concentrates employed in the hydrolysis of the basic food

Panopepton is a bright, rather dense, deep amber colored fluid, with a characteristic bouquet, grateful to the palate and stomachic The finished product contains 24% of total dry solids.

Protein	6 50	
Carbohydrates	16 50	
Ash	1	—24 00

Panopepton is of a uniform standardized composition, it is highly agreeable requires no preparation It is a potent restorative and emergency food in serious straits, a fortunate recourse for the invalid

Panopepton is a dynamic food

Panopepton is most acceptable taken cold, undiluted

Supplied in 12-oz bottles

BRONCHITIS, WINTER COUGH, INFLUENZA AND SEQUELÆ

There is a vast amount of evidence of the most positive character proving the efficacy of Angier's Emulsion in sub-acute and chronic bronchitis It not only relieves the cough, facilitates expectoration, and allays inflammation, but it likewise improves nutrition and effectually overcomes the constitutional debility so frequently associated with these cases Bronchial patients are nearly always pleased with Angier's Emulsion, and often comment upon its soothing, "comforting" effects

The Perfect Emulsion.

The unique soothing properties of Angier's Emulsion, its favourable influence upon assimilation and nutrition, and its general tonic effects, make it eminently useful both during and after influenza It has a well-established reputation for efficiency in relieving the troublesome laryngeal or tracheal cough, correcting the gastro-intestinal symptoms and combating the nervous depression and debility

Balanced
Vitamin feeding essential to Health

DISAPPOINTMENTS arising from a too ready acceptance of the exaggerated claims made for certain vitamin treatments should not be allowed to obscure the important part that vitamins fulfil in a properly balanced diet

Such disappointments are due to a false conception of the function of vitamins as a cure for all human ills, whereas what has been definitely ascertained is that the vitamins are one of several important factors in a diet, which if it is to fulfil all the requirements of health must be of correct physiological balance and suited to the powers of assimilation

The influence of Virol on health and development is due to the manner in which the vitamin foods, together with the all-important mineral salts, are in properly balanced proportions to the needs of perfect bodily health and to the remarkable ease with which Virol is assimilated There is no other food that conta ns all the ingredients of Virol in the same scientifically ba'anced proportion

A Paper on SLEEP AND ITS DISORDERS IN CHILDHOOD

BY

HECTOR CHARLES CAMERON, M.D., F.R.C.P.

PHYSICIAN AND PHYSICIAN IN CHARGE OF THE DEPARTMENT FOR DISEASES OF CHILDREN, GUY'S HOSPITAL

Of the physiology of sleep we know no more than of its pathology. Speculations as to its nature, what part is played by variations in vascularity, in blood pressure, or in osmotic pressure, whether or not there exists a sleep centre, acted upon by a hypnotoxin elaborated during the hours of wakefulness, how far the endocrine glands control the process—all such speculations afford us no help in solving the problems of sleep and its disorders in childhood.

In our discussion, therefore, we can only approach the subject with certainty from the purely *clinical* standpoint. We can only depict disturbances as we find them in practice, and discuss the *ways and means* whereby they may be combated. Views on etiology must be regarded as wholly speculative. I propose to discuss briefly in turn four examples of such disturbances:

1. Sleeplessness and continuous crying in young infants.
2. Sleeplessness in older children.
3. Night terrors.
4. Enuresis.

Sleeplessness in Young Infants

Three factors may be concerned in different cases in *varying degree* in producing this most unhappy state: (*a*) *pain* or discomfort, (*b*) inherited or constitutional neuropathy, (*c*) faulty management.

Pain or Discomfort

In a few cases the unrest is caused by persistent pain. Syphilitic periostitis, the subperiosteal haemorrhages of scurvy, uric acid calculi, otitis media, for example, must not be overlooked. The pains of dyspepsia are a more common cause. In intestinal colic the pain is caused by the increased vigour of the peristaltic contractions of the intestine, and is associated with the passage of a green watery, or slimy stool which is expelled violently from the anus with the audible escape of flatus and fluid and which may be so irritating that it causes excoriation of the skin of the buttocks. Aerophagy with distension of the stomach is an even more common cause of abdominal discomfort. But here, as so often happens in infancy, *cause and effect are hard to separate and we are confronted with a vicious circle of symptoms, each productive of the other.* The infant, in the first months of life, functions almost solely as a suction apparatus. That apparatus is effective only when the child is at rest, quiet, perhaps even drowsy. The suction act is not a voluntary but a reflex act, and the reflex is inhibited by emotional unrest. Brought to the breast sleepless, crying and excited, the child, as it were, stammers in its attempt at suction. It substitutes a voluntary, inco-ordinate, ineffective effort for the quiet, sustained, effective suction. Gulping, straining and choking it secures from the breast a minimum of milk and a maximum of air. The consequent distension of the stomach is painful. The delayed peristaltic contraction of the fundus—a property of the infant's stomach which expels that amount of air which is always and inevitably swallowed with the milk—is incapable of achieving its purpose. Either eructation is prevented by the over-distension or eructation is so violent that the fluid contents of the stomach are ejected as well as the air. To prevent wind we must secure sleep; to secure sleep we must prevent wind. The infant must be brought to the breast *quiet and controlled*, not in a state of emotional excitement. A single grain of chloral hydrate given ten minutes before each of five or six feeds for some days, will often prevent wind. When *the infant* is quiet and drowsy the suction reflex comes into its own again, a full meal is taken without too great aerophagy, and sound sleep follows.

Nasal obstruction from nasal catarrh is one of the most frequent causes of discomfort leading to wakefulness. Not *only* does the cough constantly waken the child, but the consequent nasal obstruction interferes with suction. The infant must stop breathing in order to suck, must stop sucking in order to breathe. Aerophagy and insufficient stimulation of the breast are direct results of nasal obstruction. The two commonest causes for a failure of lactation in the first months are to be found in nervous unrest in the infant, leading to inco-ordinate ineffective suction, and to nasal obstruction in the infant, which in turn is a cause of nervous unrest. A tampon of cotton-wool which allows a few drops of adrenaline solution (1 in 5,000) to flow backwards through the nostrils before the child is put to the breast may break the vicious circle, permit nasal breathing and effective suction, and thereby prevent aerophagy and hunger with the consequent insomnia and crying.

Inherited Neuropathy

The neuropathic infant generally bears in his face and aspect the stamp of his inheritance—thin, meagre and tense with rigid face and limbs. His hands are constantly clenched; often there is opisthotonos. The outline of the recti abdominis is visible on the retracted abdomen. The scalp is usually hairy and the hair is lank and dark, generally massed on the vertex, thin and sparse on the temples. The slightest sound in the neighbourhood awakes him with a characteristic start. Instantly the anxious expression flows back into his face, and the inevitable crying begins. The response to the approach of a friendly face is not a smile, but a cry or a frown.

Faulty Management

Only a few restless babies suffer from inherited neuropathy. Most infants who are sleepless and who cry constantly without any specific pain or discomfort do so because the management is at fault. The competence of *a mother in* handling her infant varies directly with the degree of her own self-confidence. It is through the mother or the nurse that we must work to get our effects. No infant has yet met in the arms of a woman who is herself in a state of nervous tension. In hospitals and institutions infants keep all the time because they are subjected to little perhaps to too little psychical stimulation. They are cared for by a succession of kindly capable young women who *are not apt to be unduly distressed by the* crying of a child. *In an institution* the baby does not pass his time under the searchlight of his mother's face and eyes with a constant interplay between the two—coaxing appealing consoling, urging on the part of the mother—training striving, refusing resisting on the part of the child. This excessive psychical stimulus may be the cause of a restless state of fatigue. Insomnia and constant crying may follow and become persistent when the mother grows agitated and worried by the failure of her renewed attempts to dominate the opposition of the child. The best place for such an infant may be up again t the mother's body, against a warm comfortable part of her body, which takes no part in the expression of her emotions, when the searchlight of face and eyes is directed away from the child and when her hands are free to busy themselves in occupations which divert her thought from the child. For when her thoughts are so diverted peace may come almost miraculously. The mother's agitation and the infant's restlessness may act and react other in such a way that treatment must have regard to both aspect of

Chloral is believe, the most satisfactory hypnotic in infancy. A hot pack is of it is for the adult excitement may

carbohydrate In children, starvation, pyrexia, exertion, and emotional excitement, whether pleasurable or painful, tend much more readily than in adults to exhaust that meagre reserve of carbohydrate which is stored as glycogen partly in the liver and partly in the muscles In the absence of sufficient available carbohydrate, the metabolism is apt to become disturbed, and the evidence of this disturbance is found in a fall in the blood sugar, in an accumulation of ketone bodies in the blood, in a greater excretion of nitrogen, and in an increased accumulation of fat with a diminished content of glycogen in the liver When the carbohydrate level is at the lowest end of the range the body appears to endeavour to achieve the synthesis of sugar out of the ample store of body fat, which is our main reserve of energy It is a view widely held at the present time that the presence of ketone bodies in the blood in considerable amounts indicates the failure of such an attempt Some sugar is indeed successfully derived from fat, but much of the synthesis is incomplete and remains, as it were, at the stage of the ketone bodies Ketonaemia, in other words, may perhaps be *regarded as evidence of a failure to complete the synthesis* of the necessary sugar from the stored body fat

Individual children differ widely in their reaction to the presence of ketone bodies in the blood and to the accompanying hypoglycaemia The nervous child, slender, thin, and pale, with his eager or too anxious expression, with a tendency to "bouts" or "turns" or "attacks," sometimes characterized by severe and incessant vomiting, but more often merely by an increased restlessness, irritability and exhaustion, by obscure pyrexia, by anorexia or nausea by yawning, pallor, and a variety of vague muscular aches and pains, as well as by confused or terror stricken dreams, has, as has long been recognized, a low tolerance for fat It is, I think, clear from a clinical study of such cases that these sudden backslidings in physical energy and nervous control, *associated often* with clear evidence of hepatic inactivity, which the mother describes as bouts or turns are the physical and nervous manifestations of the underlying disturbance of metabolism, produced by over-exertion, psychical shocks, or intective disturbances

The reaction of young children to hypoglycaemia and ketonaemia, induced experimentally by starvation and by a diet with little sugar and a high content of fat, has recently been investigated and recorded in an interesting communication by Salomonsen The author reviews at the same time the extensive literature on the subject of ketonaemia and hypoglycaemia The application clinically of the work of Hilliger, Hecker, Frolich, Ross and Josephs, Cammidge, Osman and Close, and many others, presenting as it does much that is contradictory, has not yet been sufficiently defined or even sufficiently discussed

Fifteen young children between the ages of 1 and 4 were subjected by Salomonsen to periods of starvation of from thirty-six to seventy-two hours Within the first twenty four hours there was invariably a rapid and extreme fall of the blood sugar *in several cases it fell below 0 04* Simultaneously the blood acetone rose from minimal amounts to figures which gave on an average nearly 0 2 part per 1,000

Twelve children between the ages of 5 and 14 were suddenly put on a diet poor in carbohydrate and rich in fat In both series symptoms were produced, the intensity of which varied very much in different individuals but which comprised pallor, anorexia, somnolence, vomiting, loss of weight, increased excretion of nitrogen, hypoglycaemia, ketonuria, and sometimes a palpably enlarged liver The author notes—and this is of especial interest in the present connexion—that he was invariably able to predict which individual children would show a strongly marked reaction Plump, well-coloured, placid children were, as a rule, little incommoded But in the case of certain fragile, "neurolabile" children the *different* symptoms reached quite the same intensity as in a spontaneous attack of cyclical vomiting

In these experiments we are furnished with evidence which supports the clinical observation that it is especially the nervous child who reacts most to stress, whether starvation, previous infection, or emotional excitement

Hypoglycaemia and Disorders of Sleep

It is clear that that particular stress which in practice is most commonly the cause of an "attack" or "bout"—I mean excessive emotional excitement—is not capable of precise investigation in the laboratory, but the reaction of the children to hypoglycaemia, induced by starvation and by a diet with insufficient carbohydrate, is highly suggestive. Nor can the laboratory furnish us with proof of what seems to me equally true, that when the metabolism of the nervous child is under strain in this particular way, when we find hypoglycaemia and ketonaemia, we encounter always an exacerbation in all nervous symptoms. It is when the child is in this state of prostration, of muscular laxity, and of pallor that he is most irritable, least controlled and most apprehensive and that the difficulties and struggles of the day are most likely to lead to sleeplessness, night terrors, or enuresis. As if even the physiological starvation of the night were ill tolerated at such times, we encounter a number of disturbances in nervous children which are confined to the night or undergo exacerbation in the night. In very many children with asthma, enuresis, sleep-walking and night terrors, we may recognize the tell-tale smell of acetone in the breath. In all these conditions I believe that we may regard a low level of the blood sugar as, in some way, a cause or an indispensable part of the cause of the disturbance. The metabolism of the night differs from that of the day, because the blood sugar is at a low fasting level and a higher proportion of the energy is derived from fat as shown by the respiratory quotient. Salomonsen found that the early morning urine always contained the highest *proportion* of acetone. This is in accordance with the common complaint of mothers of such children that they get up 'at their worst,' pale, yawning and intensely irritable. Only after breakfast has provided the necessary carbohydrate is there improvement.

The sleep of certain children whenever there is some degree of hypoglycaemia and ketonaemia tends always, I think, to be abnormal. Confusion, unhappy delirium, muttering speech, restless movements, and terrifying dreams are then the after-effects of the emotions and excitements of the day.

Enuresis, in many cases I think, may be regarded as a specific night terror. It is not the child who does not care who wet the bed but the child who cares too much, who goes to sleep fearing that the accident may happen, oppressed by the conviction that it will happen, dreaming that it does happen. As a rule he is intensely unhappy because of his failing. Sometimes it is true, he hides his feelings and ostentatiously affects an air of unconcern. At times too, in the interests of his daily life he does gain genuine relief. There may be intervals when he forgets it. Yet at times of exhaustion or depression the obsession is apt to return in all its old power, and these relapses are especially prone to recur in that state of pallor, prostration, irritability and increased apprehensiveness which accompanies, and in itself indicates, a blood sugar at the lower levels of its range, ketonaemia, and an inactive liver.

I do not mean to deny in the least the importance of the psychological aspect of the problem but at the moment that which I particularly wish to emphasize is the close association in childhood between mental states and states of metabolism. In the state which I have tried to describe I think that we find a powerful predisposing cause of disorders of sleep. In adults alcohol may bring sleep because it brings courage—Dutch courage we call it—which turns the mind from worry, from the investments which have succeeded, from the disappointments of the day to the hopes of to-morrow. When the blood sugar is low the mind is apt to be agitated restless, apprehensive. In such a case either sleep will not come to the child or sleep is light and the unrest of mind is shown by morning or muttering speech, by unhappy dreams, by night terrors or by enuresis.

Rest wise and understanding management and a diet with a higher percentage of sugar and a somewhat lower percentage of fat, are the chief needs of the nervous child. It is interesting to speculate how far the introduction on a large scale into the dietary of man of the most easily assimilated food stuff—sugar—has been necessary to enable him to stand the strain and to combat the nervous exhaustion of the increased speed at which he lives. To Shakespeare sugar was a rare delicacy. It is of honeyed words and honeyed smiles that he speaks. Jamaica and Demerara provided for the quiet movement of the eighteenth century. The manufacture of beet sugar on a large scale was perhaps necessary before life could accelerate. How invariably in some children travel, change, rush, excitement, and so forth may produce a characteristic bout of vomiting, of asthma of enuresis, of insomnia or of night terrors—disturbances in all of which some degree of hypoglycaemia may act on a predisposing cause. All of us, under a sufficient emotional strain grow pale and lax, yawn, feel nauseated become irritable and sleepless, and lose control, concentration and the ability to face the difficulties of life. The British Army found the value of rum. The German troops had their pockets full of sugar. It is the same with the warfare of the nursery. The negativistic, difficult child, exhausted by his struggles with his parents or by some emotional shock, has a high need for sugar. In practice night terrors are very often well controlled by glucose.

Hysteria and Enuresis

I wish I could speak as confidently of the control of enuresis. But here, and especially with older children, the psychological factors concerned are more complex. In some few inveterate cases I think a true hysterical paresis of the sphincter has developed and perpetuates the incontinence. In a certain proportion of cases of enuresis, usually in boys, there is added incontinence of faeces. This form of faecal incontinence is not to be confused with the accidental discharge of a watery stool which the nervous, excited child is unable to hold. In the incontinence of faeces of which I speak and which accompanies certain inveterate cases of enuresis the escaped mass is hard and scybalous. The symptomatology is indeed identical with that which is found in organic paralysis of the rectum from a transverse lesion of the cord. Very slowly the hard scybalous mass protrudes and escapes through a sphincter which is toneless and paretic. The child is quite unconscious of this passage. The mucous membrane, normally so sensitive is completely anaesthetic. The child may not even feel a finger passed through the patulous sphincter in making a rectal examination. In practice it is not easy to demonstrate a similar paresis and anaesthesia in the sphincter of the bladder but I think that this occasional extension to the rectum, where matters are more easily investigated, does very strongly suggest the hysterical nature of some inveterate cases of enuresis.

The child is physiologically hysterical and normally open to the force of all suggestions habitually made by the grown up people around him. The hysteria of warfare differs from the hysteria of the nursery only because the nature of the suggestions offered. Hysterical blindness, deafness, mutism, and paralysis are rare in childhood because these are not the disasters feared by a too anxious or apprehensive mother. The mother of the child with enuresis is often most miserable and most pessimistic. Everything has been tried. Nothing succeeds. I have known mothers who could hardly speak of the difficulty without tears. I have a letter from the child of one such mother.

> Dear Doctor, she writes. I am now quite a dry girl. What cured me was sleeping with Daddy.

Up against this large unconcerned male. He had regained peace of mind and self-confidence.

THE GLIOMA GROUP STUDIED BY ORDINARY HISTOLOGICAL METHODS *

BY

WILLIAM BOYD, M.D., M.R.C.P.Ed., F.R.S.C.

PROFESSOR OF PATHOLOGY, UNIVERSITY OF MANITOBA

From time to time attempts have been made to subdivide the glioma group. In 1912 Tooth of the National Hospital, Queen Square, showed that clinical malignancy was associated with the presence of enlargement of the glia cells, numerous mitoses, and hyperplasia of the vascular endothelium. The most important contribution, however, is that of Percival Bailey and Harvey Cushing, who in 1926 introduced an entirely new classification of the gliomas. This was based partly on an examination of Dr. Cushing's unrivalled collection of brain tumours by means of the methods devised by Ramon y Cajal, del Rio Hortega, and the other members of the brilliant Spanish school of neuro-histologists, and partly on the correlation of the pathological picture with the clinical course. The study revealed that some of the subgroups were to all intents and purposes innocent, while others were highly malignant.

There were fourteen of these subgroups, each composed, for the most part, of one type of cell met with during the development of the brain. The classification is therefore an embryological or histogenetic one, and the cells are recognized by their reaction to the special gold and silver stains (gold sublimate and silver carbonate) introduced by the Spanish neuro-histologists. It is the object of this paper to show that the important types of tumour can be recognized by ordinary histological methods, and without the aid of the difficult and specialized gold and silver methods. In addition to haematoxylin and eosin, however, Mallory's phosphotungstic acid haematoxylin should always be used, for it stains both the neuroglia fibrils and many of the protoplasmic prolongations of the cells, so that the picture becomes much more clear-cut and characteristic.

To master the fourteen groups of Bailey and Cushing is nearly as hard as to master the fourteen points of President Wilson. But in several of these only one or two examples have been described, and others may be fused into larger groups. For the purpose of this paper only a few of the main divisions will be considered.

As the basis for classification is an embryological one, a word or two must be devoted to developmental matters. The interstitial tissues of the central nervous system consist of three main elements—namely, the astroglia, the oligodendroglia, and the microglia. The microglia is mesodermal in origin, and is therefore not truly a part of the neuroglia. So far, no tumours have been recognized as arising from this tissue. Tumours may arise from the oligodendroglia, but very few have been recognized, and as I have no experience of them they will not be discussed here. We are left, therefore, with the astroglia and the cells from which it originates.

The epithelium of the medullary groove is the starting-point of the entire central nervous system. From this there arise two very different sets of cells: (1) spongioblasts, elongated cells which form the sponge-work or interstitial tissue of the nervous system, and (2) neuroblasts, rounded cells which develop into neurones. In addition, there is a third group of "undifferentiated cells" regarding which little definite is known. They may remain undifferentiated, being known as medulloblasts, or they may become differentiated into neuroblasts or spongioblasts. It may be that the oligodendroglia arises from some of these cells. We are concerned here only with the undifferentiated form, the *medulloblast*. To return to the other two main branches of the parent stem, the primitive spongioblast develops first into a bipolar spongioblast and then into a unipolar spongioblast. This in turn gives rise to an astroblast. The astroblast is distinguished from the spongioblast by the development of numerous processes, one of which becomes attached to a vessel wall and is known as the "sucker-foot." Fibrils appear in the protoplasmic processes, and the cell now becomes an astrocyte, which is the adult classical neuroglial cell. Some astrocytes do not develop fibrils. These are called protoplasmic astrocytes, in distinction to the ordinary or fibrillary astrocytes. The change from the astroblast to the astrocyte take place about the fourth month of foetal life. Some of the primitive spongioblasts remain attached to the ventricular wall, and are then called ependymal spongioblasts. When these lose their peripheral processes they become changed into the cuboidal cells of the ependyma. Both ependymal cells and ependymal spongioblasts contain tiny rods, known as blepharoplasten, by which they can be recognized.

Any one of the cells just enumerated may form the principal constituent of a glioma, so that there have been described spongioblastoma multiforme, spongioblastoma unipolare, astroblastoma, astrocytoma protoplasmaticum, astrocytoma fibrillare, ependymoblastoma, ependymoma, etc. It must be kept in mind that many of these are *but slight variations of the same theme, and, as Laing* remarks, it appears premature to urge the full adoption of this very complex classification. It seems better to wait until general usage has made its selection of terms and classes. Further, these types are not always pure. In my own experience I have found a spongioblastoma combined with an astrocytoma, an ependymoma with an astroblastoma, and an astroblastoma with a spongioblastoma. These transitions can be more readily examined in autopsy material, where the whole tumour is available, than in fragments removed at operation. Moreover, a slowly growing astrocytoma may become changed by irritation into a rapidly growing spongioblastoma.

The fundamental contribution of Bailey and Cushing is not a mass of names, but the demonstration that variations in histological structure correspond to variations in malignancy. At one end of their list of 492 gliomas there are the medullo-epitheliomas, in which the average survival period was eight months, while at the other end are the fibrillary astrocytomas, in which the average survival period was eighty-six months, some of the patients living for many years. Removal of such a tumour may be followed by a complete and lasting cure. Speaking generally, the more primitive the cell type, the more malignant is the tumour. Thus the medulloblastoma and the spongioblastoma are highly malignant, while the astrocytoma and the ependymoma are relatively benign.

This paper is based on a study of 31 gliomas obtained in the post-mortem room. All the principal types are represented, and these alone will be considered. The grouping is as follows:

Astrocytoma	16	Ependymoma	1
Spongioblastoma	9	Astroblastoma	1
Medulloblastoma	3	Unclassified	1

Most gliomas can be placed in one of the three main groups of astrocytoma, spongioblastoma, and medulloblastoma. The ependymoma is rarer, and the astroblastoma still more rare. In Bailey and Cushing's series the astrocytomas and spongioblastomas were present in equal number, while in my own material there were twice as many of the former as the latter.

Astrocytoma

This tumour, in its fully developed form, may be regarded as innocent in type. Many of Cushing's patients were alive years after removal of the tumour, the average survival period was over six years. Growth is slow, so that even without operation the course may be a prolonged one. Its benign character is explained by the adult type of cell of which it is composed. It is not suggested by the gross appearance, *for the tumour is even less well demarcated* than the spongioblastoma from the surrounding tissue, and merges insensibly with the normal brain. Moreover, it may attain a great size. In one of my cases the entire frontal lobe was occupied by the tumour. It occurs in the hemispheres both of the cerebrum and cerebellum—the former usually in adults, the latter in children. Cyst formation is common, although the reason is obscure. The cyst fluid is often under distinct pressure, which

* Read in the Section of Bacteriology, Pathology, Physiology and Biochemistry at the Annual Meeting of the British Medical Association, Winnipeg 1930.

would not be expected if the process was merely a degeneration. The only alternative seems to be that the fluid is produced by the tumour tissue. Many cerebellar cysts are of this nature. The tumour may disappear, except for a small nubbin attached to the wall of the cyst. In one of my cases even this could hardly be detected.

The microscopic picture in a typical case is very characteristic and can be recognized at a glance. Excellent examples may be seen in Tooth's paper. The cells as a rule are few in number and are separated by a dense network of glia fibril which are well stained by phosphotungstic acid haematoxylin, and which supply the chief diagnostic feature. In other cases the tumour may be much more cellular and occasionally I have found it difficult to draw with certainty the line of distinction between astrocytoma and spongioblastoma. The cells (astrocytes) and their nuclei are usually spherical but may be elongated. There is a complete absence of mitotic figures. Nerve cells may remain intact surrounded by tumour tissue. Although this is occasionally seen in other gliomas I have found it very suggestive of astrocytoma. The surrounding tissue does not show any gliosis, thus *differing from the more* malignant forms of glioma. It is therefore difficult to determine with certainty the limits of the tumour. Calcification is fairly common and may be detected clinically by means of x rays. It is best marked in the walls of the vessels but it is not confined to this position. In one case lime salts were present in the brain tissue surrounding the tumour.

By means of gold impregnation it is possible to show that some tumours are composed mainly of fibrillary astrocytes, while others consist of protoplasmic astrocytes. Bailey therefore *speaks of astrocytoma fibrillare* and astrocytoma *protoplasmaticum*. It is difficult to make this distinction in *phosphotungstic acid haematoxylin* preparations and as nothing seems to be gained by doing so, I have not attempted to separate these subgroups.

Spongioblastoma Multiforme

The spongioblastoma is the most common tumour in Bailey and Cushing's series, although not in my own. It is perhaps the most malignant of all the gliomas, and correspond to the glioarcoma of the *older literature*. The onset is rapid and the course brief. In addition to the *ordinary form*, named spongioblastoma multiforme by Globus and Strauss[2] in 1925 because of the variety of the cells which compose it a more rare type known as spongioblastoma unipolare has been described. This is composed mainly of unipolar spongioblasts. The tumour is widely invasive and recurs after removal. It may give a false impression of encapsulation because degeneration and softening may cause the central part to become separated from the firmer peripheral part of the tumour. As a rule it is softer than the astrocytoma being cellular rather than fibrillar in structure. It also differs from that tumour in being usually confined to the cerebral hemispheres. In one case it grew from the septum lucidum and separated the lateral ventricles. Not infrequently it is multiple. The several tumours should be regarded as an expression of multiple centres of origin rather than as metastases.

The microscopic appearance is very different from that of the astrocytoma, although borderline cases occur in which a distinction is very difficult. The chief characteristics of the tumour are its cellularity and the multiform character of the cells. Three main types of cells may be distinguished (1) oval, pear-shaped or elongated cells (2) undifferentiated round cells and (3) giant cells with numerous nuclei, often bizarre in arrangement. Mitotic figures are numerous and often atypical. Indeed, there is no tumour in which cell division can be more readily studied. There are no glia fibrils—in sharp distinction to what is seen in an astrocytoma. The tumour is very vascular, and haemorrhages are frequent. *Proliferation* of the vascular endothelium is a very characteristic feature, and large masses of these cells may be formed. In one case seven or eight mitotic figures could be seen in the endothelial cells in one field. As a result the lumen of the vessel may be closed and this may partly account for the frequency of degenerative changes. In some of the cases this change was observed in the surrounding brain tissue as if the endothelial hyperplasia were preceding the *spongioblastic proliferation*. There may also be proliferation of the adventitial cells. Outside the tumour there is often a proliferation of astrocytes. These may assume the form of giant glial cells but these irritation forms are never multi-nucleated, and are totally different from the *giant cells* of the tumour.

It is not so easy to be certain of the origin of the *spongioblastoma* as in the case of the other forms of glioma. The elongated and pyriform cells *appear to be spongioblasts* but the giant cells present a problem which has not yet been solved. Globus and Strauss consider that the giant cells are unripe and highly atypical spongioblasts *but this appears very doubtful*. According to Bailey, the *multiplicity of structure* is largely due to degenerative and reparative processes. More study is needed of this group and it may be that the proliferation of the vascular endothelium may prove to play a more fundamental part than has hitherto been suspected.

Medulloblastoma

As this tumour arises from one of the most undifferentiated of cells, the *medulloblast*, it is one of the most highly malignant of the gliomas. It usually occurs in children, but one of my two patients was an adult. In a child it is likely to be in the roof of the fourth ventricle, usually in the vermis of the cerebellum while in the adult it is more likely to grow from the cerebrum. The tumour is soft and reddish-grey *in colour*. It may invade the subarachnoid space *giving rise to one form* of the condition known in the literature as diffuse sarcomatosis of the meninges.

The microscopic picture shows an almost complete lack of differentiation, and suggests a round-cell sarcoma. The fibrils of the astrocytoma and the cellular variety of the *spongioblastoma* are *both lacking*. *The cells* are for the most part round, but some may have a tail like a carrot. *In places* there may be a pseudo-rosette arrangement, the cells being *collected in groups* often around a small vessel. The tails of the cells are directed towards the centre and as these tails stain poorly it may *appear as if the nuclei* were arranged round a clear space but there is *no true* lumen. In addition to the undifferentiated cells, both spongioblasts and neuroblasts may be seen in silver carbonate preparations. It is this *indirection that the cells* are bipotential which justifies the assumption that the tumour arises from the medulloblast a cell which *cannot* of itself be recognized morphologically.

Ependymoma

Bailey describes two types of tumour the ependymoma consisting of adult ependymal cells and the ependymoblastoma composed of ependymal spongioblasts. These will be considered together. Like the medulloblastoma this tumour also usually arises in relation to the roof or the floor of the fourth ventricle but it may grow from the wall of the lateral ventricle the aqueduct of Sylvius or the central canal of the cord. It is considerably firmer than the medulloblastoma. The cells of which it is composed are usually well differentiated and the tumour is of slow growth and low malignancy. Calcification is common.

Microscopically the tumour is composed of cells which are tadpole-shaped, with a single heavy tail. These cells may be grouped around a small lumen just as normally they are grouped around the ventricular cavity. To this arrangement the rather misleading name of *true rosette* is applied. The presence of these little canals is very characteristic of an ependymoma and is not seen in any other *form of glioma*. The tiny rods (blepharoplasts) are seen between the nucleus and the lumen and are quite characteristic of ependymal cell.

Astroblastoma

This is a rare tumour but it is included here because its appearance is so characteristic. It occurs in the same situations as the astrocytoma but is composed of a more primitive cell the astroblast. This cell is characterized by the possession of one large sucker foot, which is attached

to a blood vessel, it is not sufficiently developed to form fibrils The tumour cells are for the most part grouped around vessels to which they are attached by the sucker-foot, so that the condition can be recognized at a glance Although normal astrocytes are attached to the vessel wall, in the astrocytoma this arrangement is not at all evident, whereas in the astroblastoma it is the chief feature of the tumour

Conclusion

It has been shown that the gliomas can be divided into a number of distinct groups by the aid of ordinary histological methods This subdivision is of real importance, because the tumours differ not only in their microscopic structure but also in their clinical behaviour At the same time it is well to realize that this classification is in no way final It is based upon the resemblance which the tumour cells bear to certain of the more embryonic glial cells When the histological picture is typical, the recognition of the group to which the tumour belongs is very easy In other cases it is difficult or even impossible to decide how to classify the tumour It is in such cases that the special gold and silver methods of staining place so powerful a weapon in the hands of the pathologist, for by means of them the minute morphology, and in particular the processes and fibrils of the cells, are brought into prominence In the majority of the gliomas, however, the ordinary methods of histology are sufficient for diagnosis and classification

THE VALUE OF X RAY DIAGNOSIS IN MEDICO-LEGAL CASES *

BY

A HOWARD PIRIE, M D,

RADIOLOGIST TO THE ROYAL VICTORIA HOSPITAL, MONTREAL.

THE use of *x* rays in medico-legal cases began shortly after their discovery Unfortunately the first legal cases that occurred were due to burns caused by the rays Later on, *x*-ray evidence was called in to help in legal cases where the patient had suffered a fracture, and the *x*-ray plate was allowed as evidence of the fracture A time came when the operator who made the actual roentgenogram was haled to court to swear that the radiograph shown as evidence was really the one he had taken During this phase of the law I spent a whole day in court to give evidence, and though I would swear that the roentgenogram was that of the patient and that it had been made in my department, I had not actually pressed the button when the *x* rays were used, and therefore the judge would not allow me to give evidence

It is seldom now that the radiologist is called upon to testify that he made the picture In a large department with several technicians making several dozen films a day it would not be possible to be certain that a technician would remember the actual making of the radiograph in question, and frequently after he has made the exposure he does not even see the finished film, and cannot therefore swear that it was made by him Such technicalities are now waived, and the word of a responsible doctor is accepted that the film under consideration is the film of the patient required

As already mentioned, the first medico-legal aspect of *x* rays was due to the burns caused by *x* rays The earliest reference I have been able to find is a report in the *British Medical Journal* of April 8th, 1899, of a case in Paris, where Madame Mockert had her hip examined by *x* rays The first "sitting" lasted forty minutes, the second forty-five minutes, and the third an hour and a quarter The court decreed that a medical commission be appointed to decide the duration of the examination considered safe Two years later the *Lancet* reported the continuation of this case When it came up for trial, the defence was that the method of application of radiography was not yet formulated, that no one knew the conditions which gave rise to burns in some people and not in others, and that consequently the radiographer was not responsible The court gave the full amount of damages asked for (5,000 francs) and found that the radiographer had acted imprudently, more like a workman than a medical man, and that his apparatus was defective The judgement was subject to appeal

It is interesting nowadays to think of exposures of forty to fifty and seventy-five minutes in order to make a roentgenogram The dose of *x* rays which will cause a burn is pretty exactly known now, and, though there may be a slight difference in the reaction of one person compared to another, it is not sufficient to justify a statement that a dose which will have no effect on one person will cause a serious burn on another

Again, the London *Daily News* of May 1st, 1899, records that in Chicago a patient was awarded 10,000 dollars for injury caused by the *x* rays These are the earliest medico-legal cases I have found

In June, 1901, Mr Golding Bird wrote in the *British Medical Journal* on the medico-legal aspect of *x* rays in regard to fractures, and pointed out the necessity of employing an expert to make the roentgenogram and an expert to interpret it There is no need to dilate on the fact that this advice, given thirty years ago, is as sound to-day Mr Golding Bird cites instances in which a skiagram has shown what appeared to be a fracture where none exists, others in which a fracture has been missed altogether, and others again in which, owing to the well known translucency of young callus to the *x* rays, it is possible to show a fracture as still existing which has united sufficiently to bear weight, and he arrives at the conclusion that skiagraphy should be employed only as a subsidiary agent in diagnosis, and that even in this secondary capacity its evidence in cases of difficulty and doubt should be received with caution and only after due interpretation by someone whose experience warrants him to speak with authority

X-ray films can be used to great advantage in medico-legal cases without ever reaching a court I remember one such case in which a woman fell from a moving street car and claimed compensation for a fractured femur above the knee She was carried to her home, where she lay for six weeks under the care of a doctor, and was then transferred to the Royal Victoria Hospital, where an *x* ray of her knee was made It showed a fracture above the knee in poor position, and callus was present I formed the opinion that the fracture was much older than six weeks Shortly after this, a representative of the street railway company, the claims adjuster, came to see me and said "We admit the accident and the fracture, and wish to settle for it without going into court" In the interests of justice I felt bound to express my opinion that the street railway company was not responsible, and that the fracture might have happened ten years earlier The agent was dumbfounded, and asked me what he was to do I told him to investigate the accidents brought to hospitals in the city for the last twenty years, and look out for the name of the patient He did so, and at the third hospital he found the name of the woman and the fracture described six and a half years previously With full information on the case he charged the woman with intent to defraud, and she admitted it and withdrew her claim The company had been willing to settle for 2,000 dollars

The occurrence of a pathological fracture, due to negligence of the same street railway company, again brought the same claims adjuster to me, and once more he told me his company admitted responsibility and wished to settle out of court *X* rays showed a recent fracture of the femur The surgeon in charge of the case was surprised when I pointed out that the fracture was a pathological one The case went to court as an ununited fracture, and it was admitted in court that it was a pathological fracture,

* Read in the Section of Radiology at the Annual Meeting of the British Medical Association at Winnipeg, 1930

but nevertheless the patient was awarded 2,000 dollars compensation The judge took the view that the company should have left the road clear so that a person suffering from metastatic carcinoma would not trip and so suffer a pathological fracture The patient died from metastatic carcinoma about six months after the accident

Medical men who have no right to express an opinion on a radiograph may be heard in court making beginners' mistakes, calling epiphyseal lines fractures, and normal extra bones broken pieces of bone A thorough knowledge of epiphyses and their times of union is not all that is required of an expert He must also know the unusual epiphyses and the epiphyses that do not unite even in middle life

I shall give two instances of epiphyses of medico-legal importance At the proximal end of the second metacarpal bone there is a rare epiphysis It is found constantly in certain lower animals, I have seen it in the seal In one case of this sort I heard it described as a fracture, and legal action was proposed till I persuaded the patient to allow me to radiograph the bone on the other side, where exactly the same condition was seen—namely an extra epiphysis (which I call the "seal" epiphysis) that had not united The legal aspect was not considered further and no court case followed

Another epiphysis I have seen mistaken for a fracture is the one which occurs at the outer end of the acromion Such a case was sent to me for examination for compensation as a fractured scapula It is the only case I have seen in which the epiphysis at the outer end of the acromion remained as a separate bone The man was 38 years of age and a pension depended upon whether or not he had sustained a fractured scapula Knowing that it was on record that the epiphysis sometimes may not unite, I x rayed the other scapula and found exactly the same condition present in it The question of pension for fractured scapula was then dropped, and the condition was considered a normal one

The divided scaphoid bone is frequently found I believe this always follows a fracture I have never seen a case which I considered was a scaphoid bone developed in two parts When the scaphoid fractures one half may degenerate while the other half remains normal Sometimes it is the distal half which degenerates and sometimes it is the proximal This phenomenon is due to the blood supply which enters by the interosseous ligament between the navicular and the capitate If the fracture is proximal to this ligament the proximal half of the bone stands still and remains as a sequestrum, while if the fracture is distal to the ligament the distal half stands still while the proximal half with the good blood supply loses its calcium from disuse

Fracture of the semilunar bone is a rare injury When therefore a patient claims that a recent injury say seven days ago has crushed his semilunar, and the x rays show a crushed semilunar one has to be able to distinguish between a recent and an old fracture A thorough knowledge of the formation of callus is necessary Callus may be present that can be felt clinically, but it may not appear in a film because calcium has not been deposited in sufficient quantity to make itself evident Certain bones form much callus, like the tibia, femur radius and ulna, while the bones of the scalp show usually no callus after fracture

It is important to know the rare bones of the foot and wrist as these may be called *fractured pieces* by those who know anatomy as taught to the medical student I shall mention a few of these as possible pitfalls in medico-legal cases

1 The os trigonum is a separate part of the astragalus in about 10 per cent of normal feet

2 The os peroneum is a sesamoid bone in the tendon of the peroneus longus It is found in 10 per cent of feet examined and may be single double triple or multiple in appearance

3 The extranavicular lies between the astragalus and the navicular I have seen this bone in over thirty cases during the last thirteen years

4 The internal sesamoid bone of the great toe may be in two or three parts and yet be normal I have never found the external sesamoid of the great toe other than single

5 The tibiale externum is fairly common It occurs in about 10 per cent of cases examined.

6 Other bones of the foot seen more rarely by x rays are the secondary os calcis, the intermetatarseum and the os vesalianum The latter I have seen as an epiphysis and only once in an adult The fact that fracture occurs so frequently at the base of the fifth metatarsal bone makes it important to distinguish an os vesalianum from this fracture

7 Fracture of the os calcis should be examined in three directions only one of the three may show the fracture The lateral view may show fracture only by the want of proper arrangement of the trabeculae

In regard to diagnosis of certain fractures it is well to bear in mind these points

1 A Potts fracture and other fractures may be easily seen in one view and not in another, therefore at least two views at right angles should be made of every fracture

2 Fractured ribs may be invisible in one view and visible in another The perfect examination for fractured ribs is three stereoscopic views of the chest on 14 x 17 inch films one view antero-posterior, one at the half left position, and one at the half right position

3 The patella may develop in several parts, and this condition simulates a fracture I have seen three cases of this, and in each case the condition was present in both patellae

4 Fractured skull may similarly be only visible at certain angles My routine examination for fractured skull is stereo right and stereo left views, an antero-posterior and a postero-anterior view—six in all Other views are made at times, such as a stereo of the foramen magnum and the surrounding bones I have seen a fracture of the right parietal bone visible in the right stereo film, and invisible in the left stereo film Meningeal artery grooves and diploic sinuses are so irregular in position and appearance that much experience is required to diagnose these from a fracture

A few practical points of differentiation are as follows

(*a*) Meningeal grooves have white edges and fractures have not This is of value only when the white edge is seen

(*b*) Fractures may branch like meningeal grooves

(*c*) A 'meningeal groove" which does not begin at the base should be suspected as a fracture

(*d*) A diploic sinus may run in any direction as may a fracture

(*e*) Fracture of the base of the skull is seldom seen by x-ray examination It may be seen in a postero-anterior view in the base of the orbit or in a stereo view of the foramen magnum

(*f*) A fracture line may be narrower than a meningeal groove and it may be wider than a diploic sinus

(*g*) A depressed fracture causes a white line, or a black and-white line, while a simple fracture causes only a black line

Anomalies of the spine are very common As pointed out by Cushway and Maier[1] in an analysis of 916 symptomless spines, anomalies were found in 45 per cent No symptoms were present in cases of scoliosis old fractured ribs old fractured pelvis old fractured vertebrae spondylolisthesis and acralization

Some other points of medico-legal interest may be referred to here Other condition may be found along with a fracture such as osteo-arthritis, Paget's disease, calcareous vessels periosteal thickening or line and these delay the return of function A negative ray may be as important as that of a positive fracture Severe and permanent injury may occur in which x rays show nothing

Both shoulders knees hands feet and hip joints should be taken as a routine, it involves little extra work and expense, and proves of great value in some cases.

Before giving an opinion in a medico-legal case the following points should be considered

1 X-ray evidence is only part evidence The complete physical and symptomatic evidence and history make up the whole evidence

2 The roentgenologist has as much right to know the history of the case as the physician has Even a pathologist demands information before giving an opinion

3 The roentgenologist should be familiar with the clinical aspect of the case, and read or know the literature on the subject before giving evidence

4 An x-ray serves to prevent a malpraxis suit, and the want of an x-ray in a fracture case is considered malpraxis

5 It is not the duty of a roentgenologist to express an opinion on the amount of disability likely to follow a fracture by simply examining the roentgenogram

An instructive table showing the average number of days of disability following 3,254 fractures is given by Davis[2] This is a useful table, as an example from it, let me ask you How long do you consider is the average disability following a fractured os calcis? Davis gives it as 118 days He gives a fractured femur 208 days, a Colles fracture 48 days, and so on throughout the series of common fractures

Dr M H Todd[3] has analysed 551 fractures at the Lynch Kentucky mines, where the fractures have been followed to the final result He concludes that return to light work is the best form of treatment, and is better than massage and diathermy He found a remarkable difference in the speed of recovery, depending upon whether or not the injured patient was a compensation case In his experience really serious disability following a fracture is very rare The only exception is compression fracture of the spine, where a little disability persists He reports 47 fractures of the spine, of which 19 were compression fractures of the twelfth, or first or second lumbar vertebra, from the patient being bent violently double

Pitfalls will be laid for you, but with good training and experience, a thorough study of the case, and an honest opinion, no pitfall should catch you so long as you testify honestly in accordance with the facts You should know not only the normal anatomy but also the normal variations

I remember a pitfall being prepared for me It concerned a fracture of the cervical vertebra in a railway accident The x-ray showed a small piece of bone detached from the fifth cervical vertebra It measured 1/16 inch in the roentgenogram The opposing counsel asked me if this was a small fracture, and I answered that it appeared to be so He then cast doubt on my reply, and asked me how small it was I then saw his line of defence and that his object was to make me belittle the fracture But I was on familiar ground and he was not, and I determined to lead him on instead of him leading me, so I answered "It seems to be about 1/8 inch long" He asked, "Could it be any longer?" and I said, "Yes, 1/4 inch" He led me on "Any longer?" I said, "Yes, it might be 1/2 inch long" During this time he had been looking down towards his feet, as though he did not care about the case, but at this point he pulled his gown around his shoulders and turning on me he asked, "How long *could* it be, doctor?" I said, "about 3/4 inch, but no longer" Triumphantly he asked me to tell the court how a broken piece of bone 1/16 inch long could be 3/4 inch long I had seen what was coming and had a match ready in my hand I broke off 3/4 inch and held it up to the light showing how its shadow was 3/4 inch in one direction and 1/16 inch when seen end-wise I was asked to step down out of the box at once I mention this merely to show how familiarity with your subject can give you confidence

TUBERCULOSIS AND PUBLIC HEALTH*

BY

A S M MACGREGOR, M D, D P H,

MEDICAL OFFICER OF HEALTH, GLASGOW

In a general discussion on tuberculosis and public health two subjects will naturally receive prominence—the progress and efficiency of current preventive measures and the behaviour of the death rate, which, in many countries, is falling with greater or less rapidity Antituberculosis campaigns, however, apart from such direct results as may be attributed to them, must be credited with having accomplished much more than their immediate purpose—the creation of machinery for the control of a particular affection They have assisted and stimulated general public health measures for the common welfare, and have helped to direct the broad policy of preventive medicine along its present channels For instance, studies of the incidence of tuberculosis, particularly of the conditions which facilitate the spread of gross infection in the home and in the workplace, have lent powerful support to higher standards of housing and of environmental hygiene, and even to the promotion of social legislation They have also been fruitful in driving home lessons of great educative value in personal and domestic hygiene, such as the benefits of fresh air and ventilation Again, the rationale of tuberculosis schemes in endeavouring to secure for individual patients early diagnosis, prompt treatment, and suitable after-care is applicable with equal force to many other affections Thus the problems raised by tuberculosis are also fundamental problems of public health There is no doubt that the prevention of disease and ill-health generally has been greatly furthered by the tuberculosis campaign, which, by holding out the prospect of controlling tuberculosis, took a firm hold on the imagination of the public a generation ago

The tactics adopted in attacking tuberculosis follow the model scheme laid down by Sir Robert Philip, which is now applied more or less fully in most countries Tuberculosis schemes have retained their well-known classical features with little alteration since they were evolved and expounded by their author That they have stood the test of time and experience is a tribute to his acumen and foresight, and it may be remarked that he clearly perceived the intimate connexion between tuberculosis and public health when he presented his work and ideals to the nation for incorporation in the public health system of the country

In a brief introductory survey it will be convenient if I limit my remarks to a few observations on some of the administrative measures in operation for reducing sickness and death due to tuberculosis I have hesitated to use the common expression "eradication of tuberculosis," a term which is frowned upon by students of immunity as connoting an impossible or even dangerous ideal

The Tuberculosis Dispensary

The broad functions of the dispensary or clinic are well known and clearly defined as an educative centre and "clearing-house," related on the one hand to the homes of the people and on the other to the institution for treatment It performs with minute care every possible social, medical, and preventive service on behalf of its patients, and is most efficient when closely related to, or forms an outpost of, a public health organization As a centre for diagnosis it must have free access to an up-to-date x-ray department, and, if need be, to observation beds In cities such as Glasgow, where much chronic respiratory disease exists, the differential diagnosis of chest affections becomes an important and often difficult duty, and tuberculosis dispensaries tend to become centres for the diagnosis and treatment of a variety of chronic diseases of the lungs They are often criticized for this tendency, but I am not sure that this is a bad thing, provided the physician maintains a due sense of perspective and does not, as sometimes happens, indulge in a riot of over-diagnosis, especially in dealing with children This raises

*A paper read in opening a discussion at a joint meeting of the Sections of Tuberculosis and Preventive Medicine at the Annual Meeting of the British Medical Association, Winnipeg, 1930.

the question whether these dispensaries have not tended to develop, as regards their medical functions too much as "*ad hoc*" centres and rather too little along the main current of general medicine As effective instruments of detection these clinics are confronted with great difficulties in tracking down incipient tuberculosis Protection of the contact is not so simple a matter as it seemed at one time, while it must be confessed that in the more acute type of phthisis prevailing among young adults the results as regards early diagnosis and treatment have been disappointing This type of affection still tends to be advanced when detected, and efforts to control it are defeated by its natural history In fact, phthisis at this age period has remained with undiminished volume and unabated severity, although it has markedly declined as an affection of middle life and of younger ages The Tuberculosis Society has devoted much consideration to studying and perfecting the machinery of detection Those who are carrying on field work realize that the problem is one of extraordinary difficulty, created in great part by the epidemiological characters of the disease itself The persistence of young adult phthisis is a disquieting feature, and constitutes a problem for special investigation

Institutional Provision

This takes the form of the sanatorium and hospital, or of both combined They are administered on the same principles, except that the former makes a braver attempt to effect radical cure From a preventive standpoint it is very important that the latter type of institution should be ample for the adequate and prompt isolation of the infectious sick No scheme is complete without this necessary provision which should take precedence over all other considerations The relative proportion of purely sanatorium and hospital provision will vary according to the circumstances of the area, especially its housing conditions In Glasgow, for instance, approximately 12 per cent of the population live in one apartment houses and 48 per cent in two apartments Phthisis being an infectious disease, domiciliary treatment of advanced cases becomes an impossibility under these conditions, and the preventive problem has to be faced on lines of generous provision for highly infective patients By this is meant institutions run on "sanatorium hospital" lines where moderately advanced and advanced cases can be treated within easy access of their homes, and on a large enough scale to prevent them from being stigmatized as homes for the dying The nature and extent of institutional provision is also arrived at by studying the stage of the disease at notification and the after-history of the patients In a series of 2 500 cases in a large industrial area of the city 55 per cent were advanced cases on notification Following these to a conclusion, 87 per cent were dead within two years of notification Facts like these give the keynote to the type of accommodation required, when considered along with the average housing conditions The policy pursued has therefore taken the form of providing some 800 beds of this type and 200 for the more definite sanatorium patients for a population of 1,125,000 persons —a proportion of beds to population which, though high is not yet quite sufficient to meet the demand for hospital beds This is rather reversing the usual practice, but, besides being a humanitarian measure, it is essential in order to minimize the risk of gross infection at close quarters in small houses

The death rate from phthisis in Glasgow is now a quarter of what it reached about the year 1870 and its present rate of 0 9 per 1,000 compares favourably with that of many other large cities much better circumstanced as regards their housing conditions Further, in contrast with many other areas, the descent began from a much higher level of incidence Scotland s death rate was then almost twice that of England I mention these facts because Glasgow appears to afford a very suitable environment for an infection which is presumed to spread by close contact It is a closely packed "tenemented" city, the houses of the poorer classes being small and overcrowded presenting in a high degree features of propinquity favourable to tuberculosis The behaviour of phthisis under these conditions illustrates the powerful nature of the protective forces at work As to what these may be, there is no unanimity The epidemiological facts fit a number of theories, and the administrator finds himself operating a large and somewhat unwieldy machine with no very clear notion of its precise relationship to the natural history of the disease, although aware that he is being assisted by some unknown agency or agencies A generally accepted view is that progressive urbanization means progressive tuberculization resulting in a gradual acquisition of resistance, unless this is delayed by unduly low hygienic standards of life The position of a community on the tuberculosis curve is probably the resultant of a complex series of forces, including a tendency to relatively high rates of incidence among susceptible country stocks from outside in proportion to their number and rate of influx The older-established urbanized and well housed elements develop an increasing degree of resistance, a process which, on the other hand, is definitely retarded among the inhabitants of slum areas Administration, broadly speaking proceeds on the principle of (*a*) providing suitable care and treatment for the affected individual, (*b*) preventing as far as possible massive infection of contacts, and (*c*) improving housing and other environment until medical science has succeeded in evolving some specific method of making individual resistance more secure Something of the same differential process is at work in Canada, where Dr D A Stewart tells us that the death rate among the Anglo-Saxon population has been halved, while the Indian populations of Manitoba and Saskatchewan are literally sodden in tuberculosis

Looking at the large decline in Glasgow a little more closely there are two very striking epidemiological features Practically no impression is being made on the death rate from phthisis affecting young adults of either sex between 15 and 25 years of age This type appears to have remained unaffected in both incidence and severity On the other hand, a remarkable fall in phthisis at later ages has taken place in both sexes, most markedly among women These conclusions are evident from the charts prepared by Dr J A Wilson for the large industrial district of the eastern area of the city with a population of 200 000 persons in which the deaths due to pulmonary tuberculosis since 1910 have been plotted according to the age at which symptoms of the disease first developed They show the relative immobility of phthisis at ages 15 to 25, in contrast to the speedy reduction at younger and later ages the rate for 35 to 45 years in women having fallen by over 50 per cent in twenty years Among the male population the trend in the same direction is very decided, though for older ages the rate was increased during the war years, but is now approximating to the low level for females It would appear as if tuberculosis were rapidly declining as a chronic affection of the middle aged, but remaining unaffected as an acute affection of young adults, possibly subject to different epidemiological laws

Non pulmonary tuberculosis is on a somewhat different footing as it is derived from two sources human and bovine Its prevention depends, as far as our present knowledge goes, on (*a*) the control and diminution of human sources of infection, (*b*) the elimination of bovine infection, (*c*) adequate and suitable means of treating the individual, so as to reduce the incidence of crippling deformities In this last respect the pioneer work of Sir Henry Gauvain at Alton has afforded a very clear idea of what is involved in the treatment of tuberculous lesions Sufficient provision of institutional facilities for special treatment should be an essential part of a tuberculosis scheme to allow of prompt treatment at the earliest stages The attainment of this ideal should almost entirely eradicate crippling due to tuberculosis This is the policy pursued in Glasgow, where, with the recent opening of Mearnskirk Hospital for children, it will be possible to increase the existing provision of 350 beds to a total of approximately 750 beds for this purpose

Till within recent years Scotland has had a relatively high incidence of non pulmonary tuberculosis For one thing it is said that dairy herds in this country have ten times as much tuberculosis as those in America Whatever be the reason, however, the death rates from these forms of the disease have, since the first decade of

the century, declined at a more accelerated pace than we have with the rate of fall for the pulmonary form. The regards been, in fact, two concurrent movements. As abdominal mortality, tuberculous meningitis is one-third, of the tuberculosis one-fifth, and other forms two-fifths rates then prevailing. Along with this, there has been noticeable a decided diminution in the severity assumed by the various forms of tuberculosis at the younger ages of life, applying particularly to glandular and abdominal disease, but also to bone and joint affections, which are showing less tendency to rapid abscess formation, while amyloid disease is now seldom encountered. It is, of course, impossible to disentangle the factors influencing these epidemiological results, but no doubt the contracting sources of human infection have contributed. It will be observed that the greatest fall has taken place in abdominal tuberculosis—a fact of considerable significance, as this affection is mostly bovine in origin. Although something has been accomplished under the Tuberculosis Order in eliminating grosser disease from among dairy herds, such a wholesale improvement can scarcely be credited to this cause. It appears much more likely that the greatly increased practice of pasteurization of ordinary city milk, to which 80 to 90 per cent. of the supply has been subjected for some years, has interposed a degree of protection against transmission of this form of tuberculous infection. This is a subject which is worthy of the fullest investigation as part of the very vital question of the relation of pasteurization of milk to the public welfare.

PERSONAL EXPERIENCES IN MIDWIFERY

BY

R. KELSON FORD, M.D., M.M.S.A.,

SHAROE GREEN HOSPITAL AND MATERNITY HOME, PRESTON, LANCS.

THE publication of individual hospital statistics is occasionally somewhat misleading, particularly with regard to midwifery, for selection of cases almost always takes place to some extent.

For instance, one of the best-known maternity hospitals in London has recently published a statement that there have been no maternal deaths in three years out of many thousands of cases. It is doubtful whether mentally unsound persons, or those suffering from advanced tuberculosis of any kind, or those with active septic infections are freely admitted, but these patients must be treated somewhere, and the series reported below is offered for consideration as entirely unselected.

This analysis represents some 1,300 cases, forming a *consecutive series in an institution*. The majority of the patients were private bookings, the remainder being made up from a county council, a county borough council, and a Poor Law authority. Almost all of them were drawn from labouring classes, though other social classes are also represented. A large proportion of the patients worked, chiefly in mills, till shortly before confinement. Though all of them were officially under my personal care, a certain number were under the charge of other medical officers during my absence, from 1926 to 1930.

It should be explained that the institution in question has no *x*-ray apparatus, and has not hitherto been able to obtain *x*-ray reports as to presentations, etc., also that it has no suitable arrangements for infants, and no incubator.

Ante-natal attendances have been very satisfactory, though instructions have by no means always been followed. In thirty-seven cases attendances were very bad. In seventy-six cases the patients were seen for the first time on their admission to hospital. Patients still sometimes prefer their own treatment for constipation, etc., and fear dental treatment; sometimes dentists have declined to extract when I wished it.

More than half the patients were primigravidae. One point brought out very clearly, though not sufficiently for statistical purposes, was that in a large number of cases pregnancy preceded marriage. The ages of the patients concerned have varied as would be expected, the youngest being 15 and the oldest 45. The oldest primigravida was 13. The longest duration of marriage before pregnancy occurred was seven years.

The average diagonal conjugate measurements, taken over part of the series only, come to 4·7 inches. Though this is very near the 4¾ inches usually considered normal, a surprisingly large number of patients were encountered in which this diameter lay between 4 and 4¼ inches. A very definite impression was gained that pelves affected by a slight degree of contraction are definitely on the increase. On the other hand, flat pelves were rarely met with. One instance of Naegele pelvis occurred.

With regard to presentations, there were no instances of face or brow presentation apart from anencephali. There were twenty-six breech deliveries, three following failure of external version. External version was performed fifty-six times, of which fourteen were successful only under an anaesthetic. The number of occipito-posterior presentations treated by Ballantyne's padded binder has not been recorded, a large number of cases were also successfully treated by this means during labour.

ANTE-NATAL CONDITIONS

There were forty-five admissions for ante-natal treatment; ante-natally a large variety of conditions were encountered.

Various forms of established heart diseases	24
Active pulmonary tuberculosis	7
Non-tuberculous diseases of lungs	6
Active tuberculosis of glands of neck	2
Tuberculosis of elbow	1
Venereal diseases	12
Bartholinitis	2
Glycosuria	4
Epilepsy	3
Pyelitis (pyelonephritis)	4
Erysipelas	1
Otorrhoea	3
Breast abscess	2
Salpingitis	2
Subacute rheumatoid arthritis	1
Chorea	2
Pernicious anaemia	1
Splenomedullary leukaemia	1
Fibroids	2
Procidentia	1
Pelvic ovarian cyst	1
Pelvic dermoid cyst	1

One patient, sent in as a case of ante-partum haemorrhage, was not pregnant, but had a large haemoprosalpinx.

Of maternal deformities, retracted nipples were the commonest but in only two cases was an extreme condition seen early enough for operation. Supernumerary nipples were uncommon, appearing about five times. Septate vagina was seen twice. One patient suffering from progressive muscular atrophy was admitted twice. Rigid cervix was encountered once. During labour eighteen patients became unmanageable, but only once was the condition definitely diagnosed as insanity of labour. Reproductive insanity occurred on five occasions—once in pregnancy, once in labour, and three times after delivery. After delivery one patient developed chorea, two developed pleurisy (one of whom later became frankly tuberculous), and two developed apparently aseptic phlebitis.

Albuminuria was met with frequently, and has been classified as slight, moderate, and severe, the severe type being that found in pre-eclamptic toxaemia. The number in each group was: slight 126, moderate 52, severe 52, in addition, eclampsia occurred four times. In slight cases regulation of the bowels and increase of fluid intake were usually sufficient treatment. Moderate cases frequently responded to a mixture of the mist. buchu co. type. These patients were often placed on a meat- and salt-free diet. Severe cases were admitted whenever possible. Colonic lavage, barley and lemon water by the mouth, and the same mixture usually sufficed to bring about rapid improvement. In eclampsia a veratrine preparation is given at the first sign of a fit, and morphine and hyoscine may be used later, with an anaesthetic for delivery. Hot packs have been used.

Vomiting sufficient to be called hyperemesis occurred twice in this series. As signs of ketosis were appearing, the patients were admitted and confined to bed. Gastric and colonic lavage were carried out, and the patients were fed by the rectum. In no case did this treatment suffice,

but rapid improvement followed the administration of ox bile per rectum

Latterly efforts have been made to find a reasonable analgesic which could safely be used by nurses as a routine, at all events in an institution After various trials the hypodermic injection of 1/100 gram of hyoscine hydrobromide in 2 c cm of sterile 50 per cent magnesium sulphate solution has been adopted Though patients occasionally need further injections, one dose usually suffices If given at the end of the first stage of labour the second has almost invariably been more rapid and much less distressing to the patient This procedure has now been employed in about 200 cases, apparently with considerable benefit

Caesarean section was performed twenty times for conditions varying from disproportion to pulmonary tuberculosis and heart diseases In these cases the operation has usually taken place under spinal analgesia Episiotomy was employed fifty-five times in order to avoid lacerations, and in some cases no other assistance was required Placenta praevia was encountered on seven occasions, being four times accompanied by albuminuria Accidental haemorrhage also occurred—four times with albuminuria and three times without Post-partum haemorrhage occurred nineteen times, on three of which it accompanied marked albuminuria, and was usually associated with delayed separation of the placenta

Induction of labour was performed thirty six times The original method employed was the insertion of an oesophageal tube into the uterus, latterly, however, in a few cases a warm solution of mercurochrome in glycerin (about 0 5 per cent) has been injected through a catheter into the uterus This method was first tried because of the presence of pus around the cervix It has not been uniformly successful in the induction of labour, but has succeeded on about two-thirds of the occasions on which it was used The labours have been uniformly free from the very mildest suggestion of morbidity

Forceps were employed ninety-six times (7 38 per cent) On three occasions bipolar version was performed successfully instead of high forceps Craniotomy was performed once in this series, the child being already dead The placenta was removed manually fifteen times, always followed by hot intrauterine acriflavine douches, none of these cases became morbid

Notifiable sepsis occurred sixty-five times as follows:

Following intervention	..	16
No intervention etc.	..	34
Admitted as puerperal sepsis	..	13
Admitted as puerperal insanity	..	2

An inquiry into the relation between intervention and morbidity of even the very mildest degree gives twenty-nine cases in which some form of intervention was followed by some presumably infective reaction, and 117 cases in which no sign of morbidity followed In a few instances, patients exhibited conditions ante-natally which might have influenced the subsequent development of morbidity Among these patients were those who were attending the local venereal disease clinic (unknown to me till later), others with forms of vaginitis and leucorrhoea, subjects of severer forms of albuminuria, and those whose gums and persons were filthy

An attempt has been made to classify the cases of notifiable sepsis in terms of associated pathological conditions, with the following result

Local uterine (and vaginal) infections	..	36
Pelvic infections (parametritis etc.)	... ...	7
General abdominal infection (peritonitis)		7
Blood infections		8
Breast abscess	... ...	3
Uncertain		1

Included in the above were two patients who developed mental symptoms Two are omitted from the above list, both suffering from pulmonary tuberculosis without any evidence of pelvic infection Another who was also suffering from pulmonary tuberculosis has been included as a case of uterine infection One case is noted as a case of "uncertain," the patient exhibiting mild pyrexia on the thirteenth and fourteenth days only, with no physical signs or treatment whatever

Post-natal work does not seem to appeal to the imagination of patients so much as ante-natal work There were only about 360 post-natal attendances, compared with about 6,700 ante-natal

TREATMENT

An attempt has been made gradually to standardize the treatment given according to the clinical type met with A patient who shows a rise in temperature above normal, or an increase in pulse rate to 90 or more, is considered as demanding close attention As soon as both conditions occur together the cervix is inspected and an intrauterine injection of glycerin containing 1 per cent mercurochrome is made

Uterine Sepsis —Intrauterine injection of glycerin and mercurochrome is given as above This treatment, repeated usually once but sometimes twice a day suffices almost invariably to cure the condition It should be mentioned, however, that occasionally offensive lochia are drained away from the uterine cavity through the catheter before the glycerin is injected If the rise in temperature and the increase in pulse are marked, an intramuscular injection of 2 to 5 c cm of sterile milk is administered for non-specific shock This also is often repeated daily

Pelvic Conditions —The above treatment is usually suspended when pelvic cellulitis or peritonitis appears to be developing Hot vaginal douches are substituted, and latterly hot tampons of cataplasma kaolini (*B P C*) with the addition of 5 per cent extract belladonnae viride have been found very useful indeed Drainage is naturally afforded at the earliest indication It has been found that spontaneous diarrhoea may indicate the commencement of a pelvic abscess before any definite physical signs can be elicited A polyvalent serum is usually employed

General Peritonitis —Drainage and continuous rectal saline with glucose and brandy have proved the only useful remedy in my experience I would comment, however, upon the extreme difficulty of early diagnosis Slight distension relieved by pressure was the only sign obtained in two of my cases A polyvalent serum is also employed for this condition

Blood Infections —Local treatment was always given as for uterine sepsis, and a polyvalent serum administered Remarkable benefit has followed the intravenous injection of 20 c cm of a colloidal silver preparation This has been given twice a day, but usually only once daily

Among other remedies which have been employed from time to time are colloidal calcium given intramuscularly with apparent benefit on several occasions and vaccines of different kinds, none of which has been markedly beneficial

In one case in which very mild pyrexia accompanied an apparently metastatic arthritis of the knee, aspiration of the joint was performed and was immediately followed by injection of 1 per cent mercurochrome in glycerin the condition then cleared up without further trouble

In addition, radiostoleum was given as routine in the latter part of the series While we did not obtain any results comparable with those originally published by Mellanby and Green, yet it was felt that its administration was followed by definite benefit. Ovarian residue by hypodermic injection was also employed, this was found definitely active in the induction of labour, but its use was abandoned owing to the tendency to increased haemorrhage after delivery Liver extract was used systematically for anaemia, whether primary or secondary In some instances it was administered by hypodermic injection as it was not very well taken by the mouth One case of pernicious anaemia was admitted as puerperal pyrexia, and naturally did very well In one further instance at least this measure was followed by very remarkable improvement When used, however, in toxaemias of pregnancy no benefit was observed to follow

CAUSES OF DEATH

There are twenty-six deaths in this series including those dying within a few minutes of admission Of these twenty six two were ante-partum, nine occurred in patients sent in as cases of puerperal sepsis, and two in patients admitted as cases of puerperal insanity One of the ante-partum deaths was caused by eclampsia the other by heart failure The eclamptic was not quite thirty six weeks

pregnant, and had given no evidence of albuminuria until immediately before admission. A cardiac case had a bad history of alcoholism and strangeness of manner. She was sent in for heart failure, and was improving when labour came on. She then became very excited and violent, and died in a few minutes. In both of these cases post-mortem Cæsarean section was performed unsuccessfully. The remaining deaths are attributed to a variety of conditions. It should perhaps be mentioned that as far as possible diagnoses were verified pathologically. The following is a table of causes:

General peritonitis following spontaneous delivery	5
General peritonitis following assisted delivery	1
Septicæmia following spontaneous delivery	2
Septicæmia following assisted delivery	1
Shock	2
Pulmonary embolism	2
Pelvic abscess	2
Influenzal broncho pneumonia	4
Abscess of lung	1
Pneumonia developing during puerperal insanity	1
Cerebellar glioma	1
Aplastic anæmia with suppurative pyelonephritis	1
Generalized tuberculosis	1
Acute dilatation of the stomach	1
Exhaustion following acute mania	1

Some of the cases recorded in the above table merit further notice. In one of the cases of shock death followed manual removal of the placenta for hæmorrhage in the third stage in a woman with marked albuminuria, in the other the patient was a very fat woman with chronic bronchitis and albuminuria, who died very soon after an easy forceps delivery. One case of pulmonary embolism followed white leg, the other mitral stenosis. Of the patients with pelvic abscess, one was admitted five weeks after she had had her baby at home, the other had arrived very ill from West Africa suffering from pyelonephritis. The albuminuria cleared up, but the urine remained offensive and infected. Two days after the labour rigors returned, and pelvic abscess gradually developed. This was drained, but the patient died in five weeks.

Of the twenty-six patients who died, only seven had received any assistance in labour; one of the remaining nineteen was attended by her doctor in a normal labour, sixteen were midwives' cases, two were "B.B.A.'s."

An analysis was made of the infantile deaths, of which there were ninety-one in this series. In the following table the word "uncertain" refers to cases in which no post-mortem examination was made, or syphilis was suspected but not proved, etc.

	Stillbirths	Neo-natal Deaths	Total	Proportion per cent
Prematurity	5	19	24	26·3
Albuminuria	10	5	15	16·5
Fatal deformities	6	6	12	13·2
Ante partum hæmorrhage ..	3	1	4	4·4
Pneumonia ..	—	1	1	1·1
Syphilis	1	1	2	2·2
Specific injuries	5	5	10	11·0
Following difficult labour	10	—	10	11·0
Uncertain	10	3	13	14·3
Totals	50 (3·81 %)	41 (3·15 %)	91 (7·0 %)	100

The fatal deformities were extremely varied, as the following list shows. Minor deformities have not been classified.

Anencephaly	4
Exomphalos	1
Multiple deformities (all different)	3
Patent interventricular septum	1
Meningocele (occipital)	1
Meningocele (frontal)	1
Duodenal stenosis	1

As regards injuries, lumbar puncture appeared successful in saving two or three infants. The fatal injuries were as follows:

Ruptured liver	3
Torn tentorium	6
Cerebellar hæmorrhage without tear	1

Most of these occurred in cases of spontaneous delivery.

It is perhaps worthy of mention that many infants of apparently very feeble vitality (excluding birth shock) responded remarkably to the administration of one to two drops of adrenaline in a small quantity of saline by the mouth every hour.

Remarks

1. A somewhat incomplete summary is here presented of a series of maternity cases showing a deplorably high rate of mortality of 2 per cent. If, however, patients admitted for puerperal complications whose deaths were due to other diseases are omitted, a figure is reached of 0·4 per cent. This is still very high, and yet not high enough to represent the true mortality, since some of the other diseases would not have proved fatal apart from pregnancy and labour.

2. After five years' experience with mercurochrome in glycerin it is considered that this is a reliable, harmless, and absolutely efficacious antiseptic as far as the endometrium is concerned, and, possibly, for all mucous membranes.

3. The suggestion is made that 1/100 grain of hyoscine in 2 c.cm. sterile 50 per cent. magnesium sulphate solution is a safe and fairly effective analgesic for labour, though admittedly it has not yet received sufficient trial here.

SOME OBSERVATIONS ON SYPHILIS OF THE NERVOUS PARENCHYMA

BY

R. BRUNEL HAWES, M.B., M.R.C.P.Lond.,

PROFESSOR OF MEDICINE, KING EDWARD VII COLLEGE OF MEDICINE, SINGAPORE

"Nature does not deal in schemes and diagrams every separate individual and each case has its own peculiarity." It is now generally recognized that dementia paralytica and tabes dorsalis are affections separated from each other by no distinct line, and that it is the individuality alone which determines on what part of the central nervous system the lesion shall fall, but it does not appear to be acknowledged that the same relation exists between tabes and syphilitic myelitis, the former being classed as quaternary syphilis and the latter as tertiary syphilis.

In some races in Malaya syphilitic myelitis is very much more common than in Europe, while in the same races tabes and dementia paralytica are proportionally rarer. In England Williamson[2] records only 32 cases as compared with 118 cases of tabes seen during the same period, and the opinion of many neurologists in Europe is that it is a rare disease. On the other hand, Mon Fah Chung[3] in Peking puts its incidence at 39 per cent. of all cases of spinal disease.

I record here the findings in a series of consecutive cases of parenchymatous spinal syphilis in one race—namely, the Chinese—admitted to the Singapore General Hospital during a period of eighteen months. One case of transverse myelitis with a negative Wassermann reaction and two of gummatous pachymeningitis are omitted from the series. It has been impossible in all cases to get a history of the time that elapsed between infection and the onset of nervous manifestations owing to the low intelligence of many of the patients, the frequency of multiple chancres at different times, and the fact that a true Hunterian chancre without secondary infection is rare, if present, it often passes unnoticed in consequence of being painless. Similar series have been made at the great pauper hospital of Tan Tock Seng, but as they only show the same features they are not recorded.

The series consists of two clerks aged 56 and 45, one house-boy, aged 40, one cook, aged 33 one mortuary priest, aged 52, one sailor, aged 40, one fireman, aged 26, and ten coolies average age 39 years—17 cases in all All these patients had positive Wassermann reactions both in the spinal fluid and in the blood I have divided them into groups commencing with those that can be classified as tabes dorsalis and ending with those that approached Erb's syphilitic paraplegia

The first group consisted of the clerks, the house-boy, and the mortuary priest, and were definite cases of tabes dorsalis All had Argyll Robertson pupils absence of the knee- and ankle-jerks, Romberg's sign, ataxic gait, and paraesthesia in the legs, one clerk had lightning pains, but none showed any signs of pyramidal tract involvement The second group, consisting of three coolies, aged 48, 35 and 30, begins to show involvement of the pyramidal tracts All had Argyll Robertson pupils and Romberg's sign, but the first had both knee- and ankle-jerks present, with a bilateral Babinski sign, and the second had increased knee- and ankle-jerks with slight spasticity of limbs, but the plantar reflex was flexor and there was commencing optic atrophy The third coolie, whose loss of pupil light reflex showed only on the right side, had lost both knee- and ankle jerks, yet gave a shortening reflex in the left leg and a normal plantar reflex The third group, consisting of two coolies, both aged 35 is only separated from the above because neither exhibited any alteration of the pupil reflexes, both showed Romberg's sign and had absent knee- and ankle-jerks, yet one had a bilateral Babinski sign with girdle pains and the other no Babinski sign, but paraesthesia and paresis of both legs The fourth group is composed of the fireman, aged 26, and two coolies, aged 52 and 49, all exhibiting normal pupil reflexes, a positive Romberg sign, and greatly increased knee- and ankle-jerks The fireman had also retention of urine, a Babinski sign, and shortening reflex on the left side, with hypotonia in both legs The elder coolie had complete loss of pain sense to the level of the iliac crests, and no plantar reflex could be elicited, although he showed a shortening reflex in both legs, the younger had optic atrophy, difficulty in micturition, with shortening reflex, but no Babinski sign The final group is composed of five cases one cook aged 33, one sailor, aged 40 and three coolies, aged 42, 39, and 34 The symptoms varied from those suggesting transverse myelitis, exhibited by the cook and the sailor, with complete paralysis of both legs, anaesthesia to the waist, a bilateral Babinski sign, and increased knee- and ankle-jerks (with, in the former complete incontinence of urine and faeces, and in the latter retention of urine), to those of incomplete transverse myelitis in the coolies aged 39 and 34, and to the coolie aged 42 who showed extreme spasticity in both legs, difficult micturition, and whose sole sensory change was some tingling with diminution of localization sense in the legs

This is a small series, but for the purpose of this note it is sufficient, since other series collected in Singapore show exactly the same features, the cases are therefore a representative consecutive series of what we are accustomed to see The noticeable features are (1) that the grading from pure posterior root and tract lesions to almost pure pyramidal tract lesions is too gradual to warrant the assumption of differing etiologies, (2) that the lesions of tabes dorsalis are shown most characteristically in the first group containing those patients who had not spent their life in hard manual labour—namely, the two clerks, the house-boy, and the mortuary priest, and (3) that some improvement often occurs in those cases with paralysis of the legs (which is usually of sudden onset) with the enforced rest alone and before the commencement of specific treatment. To explain these features we can, of course invoke the usual hypothetical toxins which, being hypothetical will do whatever is required of them to explain difficulties—toxins of that extraordinary biological conception of a neurotropic strain of *Treponema pallidum* truly extraordinary since impotence being the rule in the large majority of the cases, the strain must be one with a suicidal tendency

Considering now the pathology of the disease, with a view to confirmation or otherwise of the suggestion that bodily activity has an important influence on the consequences of infection, it may be recalled that 'the type of the soil in which *Treponema pallidum* is sown in more important in determining the type of syphilis than is the strain of the organism"[4] Buzzard and Symonds note that syphilitic myelitis is more common in England among soldiers, and suggest that great fatigue, exposure, and alcohol may be the determining cause[5]

The changes which are present in all types of syphilis and are common to all, are the vascular changes Beatty and Dickson write "We regard the internal change as the result of a chronic inflammation caused by the poison of syphilis acting directly on the inner coat of the vessel, the *Spirochaeta pallida* being found in this coat, though it is also present, as already stated, in the degenerated areas of the media The narrowing of the vessels may give rise to nutritional changes and overgrowth of fibrous tissue in the various structures to which they are distributed or it may cause thrombosis in the vessel itself, just as do the changes in atheroma"[6] In dementia paralytica we find the main changes in the capillaries which show a perivascular infiltration in the Virchow-Robin adventitial spaces These spaces are packed with lymphocytes and plasma cells, and occasionally there may be seen elongated cells resembling collapsed capillaries[7] The vessel walls are thicker than normal, and the tissue is highly vascular, owing partly to the dilatation of vessels and partly to the sprouting of new capillaries, which are themselves soon surrounded with a perivascular infiltration

The change that occurs in the vessels after malarial treatment is merely a lessening of the amount of infiltration of the adventitia and diminution of the number of plasma cells, causing them then to resemble the capillaries seen in lesions of tertiary syphilis Similar changes are seen in myelitis, the perivascular infiltration, or rather infiltration of the adventitia, being sometimes combined with a capillary thrombosis[8] As Mon Fah Chung notes, the thrombosis of vessels occurs without signs of inflammation[2]

Considering these changes we should expect to find that, owing to the general involvement of the capillaries, the nervous tissue must show signs of a chronic slowly evolving condition of undernutrition There is ample confirmation of this view first in juvenile paresis and tabes there is a characteristic hypoplasia of both brain and cord and in acquired dementia paralytica and tabes dorsalis there is an atrophy of both the brain and the cord

Microscopically we find that (1) the degeneration is not dependent upon any inflammatory process, (2) there is no correlation between the number of spirochaetes present and the changes found in the tissues, (3) the characteristic multiplication of the nuclei of the Purkinje cells in juvenile paresis suggests more an incomplete development than any poisoning by toxins, (4) the lesion in both is chiefly manifest in parts with a small blood supply—the cortex and dorsal region of the cord, (5) the condition of miliary necrosis in dementia paralytica, the only time where the number of spirochaetes and findings correspond is a necrosis accompanied by no inflammatory reaction and (6) the growth of fresh capillaries indicates an attempt to supply the deficiency in nutriment The history also seems to show interesting points, the long incubation period in both juvenile and adult cases suggesting a slowly acting cause

The rarity of a noticeable primary sore, and the mildness or absence of early symptoms, both suggest an individual who has a high resistance to the infection and is not likely to be suddenly overwhelmed by hypothetical toxins, which are often even incapable of producing the typical syphilitic inflammations—as witness the rarity of the usual tertiary lesions other than aortitis in these complaints

If then we picture the patient suffering from a very slowly increasing state of malnutrition of both the brain and cord it must follow that those parts which are called upon most frequently are likely to suffer the most provided that the blood supply or rather the density of the capillary bed is the same However, since the blood supply is no by any means equal throughout the different parts of brain and cord the final picture will depend upon both factors—the blood supply, and the mental and bodily activities of the

infected individual We might instance in this connexion the practical arrest of the disease which so often follows tabetic optic atrophy, as the result of this lesion all the activities are so severely affected and so much less is required of the nervous tissues that it can continue to function at this lower level in spite of the decreased blood supply W M Malamud and K Lowenberg[7] state that an affection of the meningeal capillaries may lead to meningitis, and of the cortical capillaries to general paresis

It is now clear why the soldier, the fireman, the rickshaw puller, and the coolie are so liable to suffer from involvement of the pyramidal tracts In these cases the motor functions of the nervous tissue are so often called upon for such a tremendous output, since they must continue to function in spite of exhaustion, that the individual often becomes an almost senseless automaton, marching, running or working oblivious to pain and all the finer senses, but still calling upon the motor system, including its arterial supply, for a full output of energy The symptoms in these cases appear usually earlier than the sensory symptoms of tabes dorsalis, and it is hardly to be wondered at, considering what strain is put on the system

Buzzard and Greenfield note in syphilitic myelitis that in some cases there is disease, or diminution, or complete occlusion of the lumen of the vessel, in others there is excessive perivascular infiltration with suggestion of slowing of the circulation and blood stasis, and in further cases paralytic vaso-dilatation ensues with very moderate perivascular infiltration and capillary thrombosis In all cases there is, again, interference with the normal blood supply to the cells

We have, further, a striking confirmation of this view in the more modern treatment with malaria of dementia paralytica Malaria is supposed to increase the amount of antibodies and spirocides present in the blood and cerebro spinal fluid To those who know malaria as the disease above all others that reduces the resistance of an individual to an infection, and renders him more liable to fall a victim to any contagious or infectious disease, the hypothesis that induced malaria has the opposite effect in syphilis appears to be a totally unjustifiable assumption The real effect malaria or other infections have in these cases is to give what might be termed a histamine shock effect—an action that causes dilatation of the capillaries, increasing the blood flow through them, and at the same time bringing more nutrition to the starved nerve cells as well as to the walls of the capillaries and tissues surrounding them Only in this way can the effect of malaria without chemotherapy be explained, and also the fact that, although in some cases of late quaternary syphilis the spirochaetes appear to have died out the degeneration of the nervous tissue progresses progresses in proportion to the strain thrown upon it Again, one can note that the actual fever present has no relation to the ultimate curative effect of the procedure, except that if it is too severe the secondary debilitating effect damages the patient irretrievably A similar effect can also often be seen in tabes after an irritant dose of *x* rays to the spinal cord, where a temporary amelioration of the symptoms frequently occurs as the blood flow increases in the irritated tissues

In conclusion, I have brought forward evidence that the later manifestations of neurosyphilis must be regarded as only a result of the general vascular disease They appear to be due to a slow starvation of all the nervous tissue, as well as of the tissues of the body, all through the body those tissues will first show signs of degeneration, which, having a small capillary bed, are yet required to do most work under conditions which render them unable to replace sufficiently the broken-down products of their activity The areas with the least blood supply stand the least strain, and the more vital centres, being supplied better with blood, hold out the longest

The *Treponema pallidum* is an organism which, through the centuries, has almost learned to live in symbiosis with man Although possibly emitting, continuing, or manufacturing some toxin, this toxin usually has no very virulent and rapid effect upon the tissues

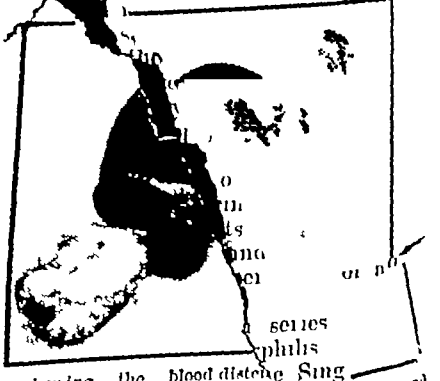
TORSION AND GANGRENE OF TUBE COMPLICATING UTERINE PROLAPSE



THE following case seems sufficiently rare to merit publication

A multipara aged 51, had suffered from complete uterine prolapse since the birth of her last child eighteen years previously The condition was controlled by means of a large "watch spring" pessary Recently, while on holiday in America, the patient consulted a doctor for attacks of slight pain in the right hypogastric region from which she had been suffering for a few months, and he advised removal of the pessary When this had been done she was very pleased to find that the prolapse did not recur, though the occasional attacks of pain persisted.

Some months after her return to China she attended a social function, where she danced, and several hours later she was seized with acute abdominal pain exactly in the locality of the former attacks I saw her an hour or so later, and found considerable tenderness and some resistance over the right hypogastric region Her pulse and temperature were both normal but a pelvic examination revealed a tense and painful swelling in the region of the right vaginal fornix

A laparotomy was performed shortly afterwards, and on opening the peritoneum some blood stained fluid was seen welling up into the pelvis On investigating, I found a black, tense swelling which proved to be a twisted, swollen, and completely gangrenous right Fallopian tube The twist, which was very tight, had occurred across the isthmus of the tube and the adjacent portion of the broad ligament forming the mesosalpinx A few adhesions of coils of intestine were easily separated, and the right tube and ovary excised The uterus, which had been drawn over towards the affected side, now proved to be extremely mobile the broad ligament and round ligaments being very lax The uterus was ventrofixed and the abdomen closed The patient made an uninterrupted convalescence

This rather unusual condition appears to have been caused by the stretching of the broad ligament and mesosalpinx, resulting in its turn from the movements of the

Photograph showing the blood distende Singapore gangrenous right Fallopian tube removed, months ted and compared with the right ovary

prolapsed uterus I think it probable that ingitis a had been present for some time, causing all cast a partial for of pain, and anchoring the prolapsing uter n infect the slight and unusual exertion made the twist ac ng to this Some strangulating the vessels in the mesosalpinx frequently, effecting the tube gangrenous There was no evidence of x and cedent pelvic inflammation, as will be seen from the photograph of the specimen, the tube was greatly distended by blood, but the ovary seemed normal

ATYPICAL FORMS OF CEREBRO SPINAL FEVER

Cerebro-spinal fever, as is well known may run its course entirely without meningeal involvement or with late involvement of the meninges, the disease remaining in the septicaemic stage Such cases, however may easily be overlooked so notes on a series may be of interest

Last year as a result of three or four cases of meningitis having been admitted and diagnosed as cerebro-spinal meningitis a careful look-out was kept for further cases, with the result that 59 others were admitted to hospital The ages of the patients ranged from 3 months to 35 years, the majority were, however, under the age of 20 Of these cases, 2 were proved to be of tuberculous origin 1 was pneumococcal, and 1 anterior poliomyelitis, 1 was admitted as enteric fever, and 2 as tuberculous meningitis, while 1 case thought to be puerperal pyrexia proved to be cerebro-spinal fever The remaining 55 were diagnosed as cerebro-spinal fever clinically

The cases varied very considerably in severity, in many there was only a few days' illness with some pyrexia, a positive Kernig's sign, and some stiffness of the neck the mental condition was unimpaired, and rapid improvement followed serum therapy In other cases there were two or three days of illness with intervening periods of apparent good health, *about 50 per cent of the patients eventually* recovering or passing into a stage of meningeal involvement One such case showed a relapsing septicaemic stage lasting just over two months before signs of meningitis occurred and death supervened, another ran an indefinite course for four months, the patient being admitted to a tuberculosis sanatorium for observation, where the disease was finally diagnosed Several cases in which diplococci had been found were followed by paralysis, simulating infantile paralysis, usually in a lower limb but twice affecting the upper, I think as a complication of the cerebro-spinal fever, but since cases of anterior poliomyelitis were occurring a possible association of the two diseases could not be definitely excluded

Deafness was seen as an early symptom in two instances, and as a later condition in one Relapses were common Kernig's sign frequently remained for several weeks after the patient was otherwise well, in all cases it was very gradual in onset As an early sign the stiffness of the neck in pulling the head forward was most valuable in diagnosis, and pain in the neck was commonly complained of Conjunctivitis was very frequent as an early sign herpes labialis was frequently seen in even the mildest cases A purpuric rash was only twice noted, and then as a very early sign The 'elbow sign" was observed in 16 cases The headache was frequently distressing and early delirium was usually present The neck sign" (Brudzinski) was demonstrable in many of the more severe cases

The spinal fluid was under pressure in all cases, and in infants the fontanelles were tense In most cases it remained clear, and only in three did it become frankly purulent, it was definitely turbid in three Very few meningococci were found, usually, after repeated specimens had been thoroughly investigated, one or two diplococci were demonstrated in about 50 per cent of the cases, the prognosis being very adversely affected, only two or three "positive" cases recovering The finding of diplococci was extremely difficult and required long and patient search, two or four specimens frequently being required before they could be demonstrated, indeed, in one case eight specimens were examined before confirmation of the clinical symptoms was possible In some fluids very rapid changes occurred from day to day they were negative as a rule during the first, second, and third days of illness and from the fourth day onwards "positives" were possible

The average stay of the patients in hospital was three weeks

The mortality rate was 44 per cent Among the relatively few complications observed were jaundice 1, anaemia 3, haematemesis 2 ulcerative endocarditis 2 arthritis 2, panophthalmitis 2 and parotitis 1.

The difficulty in obtaining bacteriological confirmation is interesting and instructive lumbar puncture clearing the matter up only occasionally and blood culture seldom affording any evidence In the first case probably the cord was rarely affected at all such meningococci as were found in small numbers were accidentally there as part of the general condition, any involvement of the central nervous system being possibly of the posterior basic type No increase in the bacteriological findings resulted from fluid obtained from cistern puncture, except in the case of tuberculosis Again, many of these cases were undoubtedly admitted when suffering from relapse, the primary attack having been missed or no doctor having been called in, these relapses probably accounted for some of the difficulty at least, and the failure of the blood cultures

OBSTETRICS AND GYNAECOLOGY

A meeting of the Obstetrical and Gynaecological Section of the Royal Society of Medicine was held on October 17th, with the president, Sir EWEN MACLEAN, in the chair

Vaginal Metastases

Dr GILBERT STRACHAN gave a paper on vaginal metastases in uterine carcinoma In a series of thirty cases of carcinoma of the body of the uterus he had found these metastases to be present in 16 7 of his cases One case belonging to Sir Ewen Maclean was added These cases fell into three categories In the first category were the two cases in which vaginal metastases were present before operation, and when the patients were first seen In one of these, curettage had been performed two weeks previously In the second category were three cases in which metastases were discovered for the first time at varying intervals after hysterectomy The intervals were six months, five months and nine years In the last case while the original condition of "cancer of the womb" could not be verified, the presence of the adenocarcinomatous nodule lent support to the history In the third category was the single case in which adenocarcinoma was found, first in the vagina, and only eight months later in the uterus with very rapid development and spread In none of these cases was there any submucous vaginal infiltration extending downwards from the uterus Three main methods of metastatic formation occurred by direct implantation, by lymphatic extension, or by blood stream transference Dr Strachan discussed at some length the various types of metastatic extension and their influence upon prognosis and treatment In cases of metastatic deposit with an early carcinoma of the body, consideration had to be given whether hysterectomy is justified, followed by radiation or excision of the vaginal nodule or even by removal of the vagina Dr Strachan's inclination was rather in the negative direction He stressed the necessity for carrying out a careful examination of the vaginal mucosa in all cases of corporeal carcinoma of the uterus The occurrence of metastatic nodules in the vagina in cases of carcinoma of the body of the uterus constituted not only an interesting pathological problem but is at the same time an important clinical factor, as it represented a prognostic *feature of grave omen in what might otherwise* be a favourable case

The PRESIDENT said that the facts of his case included in Dr Strachan's series were as stated He would add a further one in which the patient was a woman aged 68, a one para, who was seen by him, giving a history of blood-stained vaginal discharge for four months and practically no other symptoms Hysterectomy was not permitted although the exploratory curettage revealed typical adenocarcinoma of the body of the uterus Forty five millicuries of radon were inserted into the cavity for twenty four hours One month later nodules were found in the lower part of the vagina which, on microscopical examination, were found to reproduce the histology of the uterine scrapings Three months after the original investigation, subcuticular nodules appeared in the calf of the left leg the anterior margin of the left axilla, and in the left

suprasacral region These again were found under the microscope to show the same appearances as the vaginal nodules and uterine scrapings—the vaginal and skin nodules showing additionally, of course, the dermal tissues Dr ROY described a case of carcinoma of the body of the uterus with vaginal implantations, also two cases of cervical cancer with recurrent vaginal growths He suggested that curettage might disseminate cancer cells Dr FAIRBAIRN discussed the mode of dissemination in cases of cancer of the body of the uterus, and considered the blood stream as the most common method Dr STRACHAN replied that lymphatic spread was the generally accepted view, but that the proof of this was not very definite

Practice of the East End Maternity Hospital

DR W H F OAKLEY read a paper on the organization and methods of practice of the East End Maternity Hospital Since its establishment in 1884, this institute had attended 51,487 cases, with a maternal death rate of 1 35 The present paper dealt with the last five years' work, comprising 10,376 cases, with a death rate of 0 48 from puerperal causes, or of 0 67, including incidental deaths The hospital differed from many in that the routine work was done by midwives, and the general practitioners who formed the staff were called to abnormalities only Married women of the working classes were attended without any selection on medical grounds Very few emergencies from outside sources were admitted, so that the patients formed a true sample of the child-bearing population of the district All pathological conditions occurring in its patients were attended by the hospital Ante-natal selection of abnormal conditions was made by the midwife in charge of that department Occipito-posterior positions were considered to be serious abnormalities, and they were the commonest indications for forceps Attempts to rotate them ante-natally met with a qualified degree of success only Ante-natal version was successful in about one-half of the cases of breech presentation Great care in delivery was practised, with the result that the special dangers to the child—namely, birth trauma and asphyxia—were very much diminished, and it was therefore suggested that cases should be left as breech in teaching hospitals, in order to give the pupils as much experience as possible in breech emergencies The induction rate was only 1 2 per cent , and the forceps rate only 2 9 per cent , no craniotomies were performed, and only one Caesarean section It was considered that in many hospitals an unnecessary number of obstetric operations were performed There were 121 consecutive cases of ante-partum haemorrhage treated, without a maternal death The success was put down largely to the routine use of saline injections The incidence of sepsis was low, and the means taken to guard against it were described Treatment of local sepsis was in many cases by curetting The operation was successful, and appeared to be free from danger There were five deaths among in-patients, two on the district, and three in emergencies There were no deaths from eclampsia, haemorrhage in booked cases, or sepsis in the following normal labour The two deaths on the district were due to incidental and not puerperal causes Comparison of the maternal death rate with that of the two metropolitan boroughs from which the bulk of the cases were drawn, showed that the expected death rate had been reduced by 75 per cent The stillbirth and neo-natal death rate had been reduced, but not by the same amount, and it was shown that the unknown causes of these two events accounted for at least 3 per cent of births The successful work of the hospital was stated to be chiefly due to sympathetic co-operation between doctors, midwives and patients, together with carefully thought-out organization

The PRESIDENT offered congratulations to Dr Oxley on his excellently compiled paper, dealing with the records of a veritable obstetrical oasis The paper would attract wide attention, and might tend to modify the insistence on some of the obstetrical methods and equipment which, as teachers, they were wont to set forth He was interested to note that Dr Oxley, with scientific candour, said that in a neighbouring institution, where the methods in vogue were substantially different from those employed by himself and his colleagues, the results in terms of mortality and morbidity were almost as satisfactory He gathered that whilst reference was made to benefit accruing from blunt curettage in certain of his cases with early puerperal pyrexia, Dr Oxley would regard anything like routine curettage in puerperal infection as a dangerous procedure He was sure that the paper would evoke a most helpful discussion

Dr FAIRBAIRN said that the successful methods were those which encouraged natural function Mr Rivett thought that the continuity of the methods of the medical and nursing staff, and the tradition of the work, had much to do with the success of the hospital The early exploration of the uterus in cases of sepsis might probably give better results than when performed several days after the onset of the symptoms Mr WYATT congratulated Dr Oxley on his paper, but with regard to the curetting of the uterus for cases of local uterine infection, he thought it a dangerous procedure unless in very skilled hands He himself had had over 500 cases of local uterine infection to treat in the North-Western and South-Western Fever Hospitals, and no intrauterine manipulations had been done with the exception of injecting sterile glycerin All these had done well, some had taken some days to settle, but were not seen until the infection had been present some days With regard to the cause of death when the foetus was born macerated, at St Thomas's Hospital in over 50 per cent of cases signs of syphilis were found either in the foetus or in the parents Dr THEOBALD did not agree that local interference with the uterus in sepsis was advisable Dr OXLEY, in his reply, defended the use of the blunt curette, but did not wish to press this, in view of the opinion expressed against its employment

PUBLIC HEALTH EDUCATION

AT a meeting of the Section of Epidemiology and State Medicine of the Royal Society of Medicine on October 24th, Professor MAJOR GREENWOOD, F R S , delivered his presidential address, taking for his subject some aspects of public health education, more particularly from the point of view of epidemiology

Professor Greenwood defined epidemiology as the study of disease as a mass phenomenon, a way of looking at illness by focusing attention, not upon the sick individual, but upon the group into which, conceptually, the set of sick individuals could be merged The majority of pupils at the London School of Hygiene and Tropical Medicine, where he taught, were recently qualified medical men and women It was regarded as axiomatic that epidemiologists must be medically trained, and a suggestion that, for example, a medical officer of health might be admirably efficient without having had any formal medical training would be regarded by most people as a bad joke As one who had been brought up in the atmosphere of general practice, the speaker remarked that he was not likely to underestimate the value of medical experience Anybody who had had that upbringing and had passed through the ordinary undergraduate medical course without having had burned into him an impression of certain human realities which he would carry to his grave must be unteachable Such a man's conviction that there were myriads of facts vitally important in the art of healthy living, which the mere statistician or the mere office epidemiologist could not consider, was never to be shaken, such an experience and training would save many statistical and epidemiological blunders But few of those who had grafted hospital training on to intimate medical experience came to learn epidemiology, and a mere undergraduate training in medicine was very far from being an ideal form of preparation for the study of that subject So far as the future of epidemiological research or the provision of competent teachers of the subject was concerned, it was a matter of relatively minor importance whether qualified medical men and women were attracted to this branch or not If it could attract able young people who had had any sort of scientific education, he would have no doubt about its

scientific future Nevertheless, the pupils must be in the majority of instances young medical graduates, because the evolution of the public health service imposed more and more upon its junior members duties which were essentially clinical Nobody would maintain that the most intelligent of laymen could acquire the technical clinical knowledge requisite for the discharge of these duties save by following the *via dolorosa* of the complete hospital curriculum

Virtues and Vices of Medical Training

Most pupils would have the virtues and vices inculcated by their particular system of medical training While no emphasizing was needed for the virtues—the schooling in exact observation of particular facts and the subduing of the most thumby fingers to the precise execution of delicate manipulations—he must call attention to the vices John Stuart Mill said he had never heard an argument from the eminent Cambridge men of his time which was worth anything Whether that was just to the Cambridge men of a century ago, he could not say, it was true enough of young medical graduates now As a class they were as helpless as children in conducting an argument in general terms No doubt this was partly due to mere illiteracy", to be unable to write one's own language correctly was a drawback when the discussion must be conducted in ordinary words and not in well-defined symbols and as Professor Dean had pointed out in an admirable article in the *British Medical Journal* (September 6th, p 341) a premium was placed upon illiteracy But this was not the whole explanation, for very good arguments had been presented in very bad English More of the explanation was to be looked for in the consideration that emphasis in medical teaching was laid upon the practice of an art The student's interest was concentrated upon mastering the intricate details of how to descry the signs of a condition and carry out the prescribed treatment Undergraduate medical training was essentially technical, and there was a sound reason why it should be so A system of dogmatic technical instruction led to a certain gain which was obvious to every practitioner and a problematical loss which was not obvious Give a young man plain rules as to when to resort to appendicectomy make sure that he can operate (or, if not can telephone to somebody else who can) and it is odds on that he will save some lives that would have been sacrificed by a practitioner without that knowledge That he may, as a set-off, be manufacturing a number of incurable psychoneurotics is a remote consideration He has not to strike the balance, the epidemiologist has The teacher of epidemiology has to explain to young practical men, contemptuous of and wholly untrained in abstract reasoning that all epidemiological conclusions are based upon a weighing of probabilities"

Epidemiological Science a Balance of Probabilities

After instancing the epidemiological history of typhoid fever in this country as an illustration of his thesis Professor Greenwood went on to say that it was the duty of a teacher to inculcate in the epidemiological field the method of a judge in equity, the technique was different but the principle was the same There was however, a danger which he himself had not escaped It was not difficult for a moderately competent teacher to convince his students that much that was believed and used as the justification for acts in sanitary administration had no secure logical basis, and that many of the great pioneers whose names adorned the façade of the London School of Hygiene and Tropical Medicine often reasoned ill A youth who had been brought to that point was in imminent peril of being changed from an irrational dogmatist into an ignorant sceptic It must be made equally clear that, while for all men conscious logical reason was a principal instrument of finding truth, and for most men the only trustworthy instrument, great men attained great truths by other means The Newtons and Einsteins divined truth by an intuition, or perhaps by the unconscious synthesis of many intimations Men less great but whose mental powers far surpassed the common stature—the Chadwicks the Simons, and Freuds—divined truths, but could not test their convictions by a conscious process of reasoning, and might often deceive themselves with ham intellectual tests Chadwick's statistical blunders and Simon's scientific opportunism were faults but these men were very great because they were penetrated by a sense of the mysterious incorporation of the human race" (Burke's words), which was a wisdom more valuable to the officers of a public health service than even the calculus of correlations He pleaded that an outline of social history should be given to public health students When they understood its examples of right things done for wrong reasons, and wrong things done for what seemed to be right reasons, they would understand why very good reasoners, who were also wise men, had not always been convinced by crucial experiments in the laboratory In his own work in the division of epidemiology and vital statistics at the London School he did not set himself to make mathematical statisticians or medical historians of his pupils, but he did try to arouse in them such interest and give them such technical first aid as to fit those who cared to do so to study statistical methodology and medical history for themselves

The Aim of University Teaching

It was common in England to muddle up education and technical instruction in university teaching Those who were to spend their lives in the public health service needed both, and unfortunately they had to be acquired in the same school The technical knowledge which was at once essential and capable of being learned in a university school was not very extensive Some knowledge of administration, law, and routine duties must be thoroughly acquired and also such a knowledge of chemical bacteriological, and statistical methods was essential as would save an ordinarily intelligent man from being wholly at the mercy of experts But the present curriculum was more ambitious A great deal more bacteriology, chemistry, and statistical epidemiology was being taught than would suffice to enable a man to ask "experts" intelligent questions but not nearly enough to give him a real command of any one of the techniques The notion that the young diplomates in public health were expert bacteriologists, chemists or epidemiologists in the technical sense was absurd Most of what was taught had institutional value in the proper sense of university teaching He believed the primary duty of university teachers was institutional, not technical, teaching, and the present legal requirements made it hard to perform that duty well He gave some reasons for thinking that now and for a generation to come students trained for the public health service would not intellectually be the pick of the undergraduate schools For the ambitious man without any inner sense of a "call," the public health service offered few temptations, and for the man with a "call" the attraction of the public health service was still but faint in comparison with that of the laboratory branches On the other hand, it was necessary to attract those who, in an insecure world, were looking for something relatively safe Some men could be imbued with the scientific spirit only in a bacteriological laboratory Others, having had a glimpse of the pageant of history, or having tasted the odd pleasure of numerical analysis made cultural progress, in a bacteriological laboratory they were mere destroyers of apparatus" Both these group might leave their school with a fair measure of scientific culture if they were allowed to follow their natural bent but all were stretched alike on the Procrustes bed of the curriculum

The Exceptional Student

Professor Greenwood then pictured what would happen if a quite low minimum of technical knowledge was defined as that which an entrant to the public health service must possess and a qualifying examination were instituted on such minimum requirements Those who had passed this preliminary test could then devote a year to studying one of a series of branches of science such as chemistry and physics or bacteriology or epidemiology and statistics, or public administration and submit to a final examination confined to the chosen group But everyone could guess

what would happen if such a scheme came up for real consideration Various influential persons would insist that certain groups of facts—a different group with each of them—must be known by all public health officers, the spirit of compromise would prevail, and in the end the qualifying examination would be pretty much what the D P H examination was now, and Part II—the only part of real educational importance—would be made optional or dropped altogether No legal reform held out promise of improvement The fact was that the proportion of highly educable persons was small, that the qualities which fitted a man to rise above the common level were the undemocratic privilege of not one in a thousand, and that the system of university training apt to make that one in a thousand conscious of his powers, and help him to use them, was in the nine hundred and ninety-nine other cases largely waste of time and money Yet there was a valid answer to this pessimism—namely, that the one in a thousand was the salt of the earth, and to encourage and foster him it was wise to permit much waste The task was to devise a curriculum which would benefit the many ordinary men and not stunt the growth of the exceptionally gifted The time might come when university departments of any size would have as their administrative head a man with a sufficiently creditable scientific record not to be hostile to research, but not himself a research worker Conjoined with him would be a genuine poetic worker, free to come and go as the spirit moved him, free to teach or not to teach, as he thought fit If such a scheme was financially impossible, the department should be ruthlessly closed down In the meantime they must struggle on as best they could It could not be many years, in the present state of national impoverishment, before a halt was called, and people asked themselves whether the present expenditure on university education and research could be justified Then they might discover that a good deal which went on in universities had nothing in the world to do with university education, and almost as little to do with real research, the result would be a very drastic reconstruction

A vote of thanks to the president was proposed by Dr F E FREMANTLE, M P, and seconded by Sir WILLIAM HAMER Dr Fremantle remarked that he had never realized that a statistician could be such a guide to truth His own study of statistics had led him to infer the opposite!

HEAT STROKE

AT a meeting of the Royal Society of Tropical Medicine and Hygiene, on October 16th, Dr FRANK MARSH, pathologist to the Anglo-Persian Oil Company, read a paper on the etiology of heat stroke and sun traumatism

Dr Marsh gave a description of his company's medical organization, which included a central hospital at each of the three towns in South Persia on the company's 160 miles length of pipe-line These hospitals had a total of 439 beds, and served 26,000 of the company's employees, as well as the very much larger populations of the native towns, they were all equipped with operating theatres, pathological laboratories, and x-ray apparatus The medical staff comprised seventeen doctors and twenty-six European nursing sisters During last year 131,925 persons were treated in the hospitals or as out-patients In the Persian Gulf littoral the atmospheric temperature for two or three months of the year ranged between a day maximum of 125° F and a night minimum of 85° The European had to sweat continuously to keep his skin temperature at such a level that the circulating blood could be efficiently cooled, urine was passed perhaps only once a day, and usurpation of the kidney function by the sweat glands might occur Maladies due to exposure to heat in the absence of sunlight were common among workers in deep mines and stokers on coal-burning steamships Illness following exposure to the sun might simulate the heat exhaustion and heat hyperpyrexia of miners and stokers, and occasionally even heat cramps had been observed in manual workers under a hot sun who had access to ample water In addition to these well-known phenomena, symptom-complexes known variously as "sun traumatism," "sunstroke," and "solarism" were described in medical textbooks, where they were attributed to the rays of the blue-violet end of the spectrum—elements in sunshine rather than heat During the summer of 1929 in South Persia an endeavour had been made to discover and establish some of the factors principally involved in "sun traumatism", forty experiments performed on rabbits were described by Dr Marsh Evidence was obtained indicating that the heating rays of the sun were the sole cause of the symptoms of "heat stroke" in exposed experimental animals, and probably also in "heat stroke" occurring naturally in man Sunstroke did not ensue in a series of rabbits with shaven heads left exposed to the sun for long periods of time, the animals only suffered when the blood heated by circulation through the hot skin of the rabbit's head had raised the temperature of the whole body to "heat stroke" level The symptoms of this condition produced in experimental dogs in the absence of sunlight, in the experimental rabbit fully exposed to tropical sunlight, in the rabbit exposed to shade temperature above 115° F, and when it occurred sporadically in a human case (after making all due allowance for the difference between a sweating and a non sweating animal) were shown to be identical The conclusion was that "sunstroke," "heat stroke," "heat exhaustion," "insolation," "sun traumatism," and all the host of diseases with varied symptomatology associated with "touches of the sun," could be replaced by the one disease, "hyperpyrexia due to heat," as originally suggested by Sir William Willcox[1] It was true that hyperpyrexia due to heat was complicated in man by the effect of sweating on the concentration of salts in the blood, but, none the less, the essential phenomena of hyperpyrexia due to heat were independent of this alteration of the salt concentration in the body, since they occurred in the non sweating dog and rabbit with no salt depletion Dr Marsh added that the company's medical service had evolved an original and comprehensive scheme for the prophylaxis and treatment of heat stroke At each of the hospitals there was a specially cooled ward in which the air was kept dry and at a temperature of about 65°, even when the shade temperature outside was 130° Heat-stroke cases and all cases of fever in outlying stations were kept during the heat of the day until the cool hours between midnight and 5 a m in a cold storage chamber attached to the local ice plant During the coolest part of the night they were placed in a fast and comfortable ambulance and taken to the nearest central heat stroke ward, where they remained until complete recovery had occurred As a result of these measures the incidence of heat stroke had been greatly reduced, and it had almost ceased to count as a cause of invalidism

THE PROPHYLACTIC AND THERAPEUTIC VALUE OF VACCINES

AT a meeting of the Medical Society of London, on October 27th, with Dr R A YOUNG in the chair, Sir ALMROTH WRIGHT opened a discussion on the prophylactic and therapeutic value of vaccines

Sir Almroth Wright said that about twenty-eight years ago he first wrote a paper on vaccine therapy in which he suggested that the physician of the future would be an immunizer—he meant by that, a vaccine therapist. To-day the position had to be reconsidered, and he recalled the state of the medical world when vaccine therapy arrived Four methods of treating bacterial disease had been considered (1) the expectant method, in which nothing was done at all, (2) surgical extirpation, as in the removal of tuberculous glands, (3) serum therapy, the injection of blood derived from animals, and (4) antiseptics Expectant treatment, whether due to callousness or defeatism, was an unsatisfactory method Extirpation was a procedure introduced by the surgeon, and it was assumed that the whole of the bacterial infection could be excised, when it was found that a second operation came quickly after the first, and that the first operation seemed to have favoured the growth of the glands, the method was discarded by the surgeon himself Serum therapy had justified itself in connexion with diphtheria antitoxin, and it was assumed, as a result of one of the o

[1] *British Medical Journal*, 1920, i, 392.

generalizations due to ignorance, that what happened with regard to that organism would occur with every kind of microbe With regard to antiseptics, the laboratory study of these was, he thought, initiated when he was in South Africa People began treating pneumonia, which produced a heavy mortality, by giving creosote or other antiseptics by the mouth The ordinary use of antiseptics was applied very largely in the great war The conditions at the base in the early part of the war were that every wound was foul, and that the treatment of foul wounds with antiseptics did not make them any better That was *due to the fact that* in these foul wounds the fluid was corrupted, trypsin had passed into it, and in trypsin-corrupted lymph or serum every micro-organism would grow enormously There were two methods of treating wounds which gave good results in the sense that they got rid of, or restricted, this infection One method introduced salt solution into the wound, this produced a great flow of lymph or serum, and killed every micro-organism except a few, such as the staphylococcus and streptococcus The other method was that of Carrel, which was successful in keeping a wound clean, but, he believed, never made a wound clean These two methods he bracketed together because both were productive of a flow of serum into the wound, when the wound was in that condition it could be closed Then Professor Fleming devised certain methods, which ought to be taught in every medical school, to demonstrate that the introduction of antiseptics into a wound, *or into body fluids or lymph itself*, only made the condition worse One of these methods was the culture of living pus, and another illustrated the effect of carbolic acid on leucocytes in a lined tube

Since the period of which he was speaking the method of chemotherapy and that of bacteriophage had come forward Chemotherapy was an improved form of antiseptic treatment Ehrlich believed that the agent "606" entering the body would kill the spirochaete of syphilis and nothing else It was found that "606" exerted a lethal action in serum upon the staphylococcus and the streptococcus, and since then Dr Colebrook had worked a great deal on the matter with regard to haemolytic streptococci in connexion with puerperal fever It was found that "606" and other arsenicals did kill the haemolytic streptococcus in the blood, but here came in the difficulties of the chemotherapist It was not a mere question of finding an agent which put into the serum, would kill the micro-organism one had to find whether, when in the blood, it killed the white corpuscles at the same time as it killed the staphylococci and the streptococci Upon this depended how high the dosage could be carried It turned out that this drug would kill streptococci, but only after three hours, and a percentage of arsenicals was wanted which was just short of what would kill the blood corpuscles In practice all one could say was that the results were doubtful There was no drug which would kill the micro-organism only without poisoning the white blood corpuscles During the war Carl Browning proposed to use flavine in killing micro-organisms in wounds, stating that it was a drug which acted in the serum It did not kill the white blood corpuscles instantaneously, but it inflicted on them a certain amount of damage it was found that when flavine was put into a wound it was absorbed by the muscle, which was stained yellow, and picked up by the dressings and combined with a great number of tissues, so losing its power

From this story of failure they were thrown back upon the *method of immunization* Sir Almroth Wright said that when he introduced vaccine therapy he had it in mind that the tissues which were infected in the case of local infections were doing their best to kill the micro-organisms, but that other tissues in the body were idle, he had thought that if vaccines were injected into some of these idle and healthy tissues they might produce some *particular substance not* wanted there which would go round and help where it was wanted He had the greatest objection to applying any method until he knew by laboratory experiments that it was going to do some good Therefore, the method of the opsonic index was developed One valuable lesson learned was that with too large a dose of vaccine a negative phase occurred This question of a negative and a positive phase had rather moved people to mirth, but it was a very serious factor Further it was learned that when the infection reached a certain period bacterial products entered the blood stream from the local lesion, such auto-inoculation caused pyrexia, and again gave rise to negative and positive phases All this worked up into the formulation of some definite rules of dosage A man with few micro-organisms could be given a very large dose, but when the micro-organisms were present in large numbers the dose must be restricted very considerably The smaller the infection the larger the dose, the bigger the infection the smaller the dose When a man was auto-inoculated, like a tuberculous patient with high temperatures, very little good would probably be gained by vaccine therapy One of the most important papers on vaccine therapy had been written by Shattock and Dudgeon, who found that leucocytic efficiency had to be taken into consideration as well as the power of the serum The white blood corpuscles, if the microbes were accessible and the wound was healthy, could kill both the streptococcus and the staphylococcus But the conditions *prevailing in infections were not of this kind*, and one could not trust to phagocytosis being complete Sir Almroth Wright indicated with the aid of diagrams the results of experiments made on his own blood. He showed that when there were minimal numbers of organisms in the blood the white blood corpuscles which were controlling them might miss them and the organisms survive, when more microbes were put in, the process of killing began In addition to the organisms being killed by the white blood corpuscles, they were killed also by the serum, when inside the blood the killing was very nearly complete he thought it must have been effected by the fluids and not by the white blood corpuscles, because the latter amounted only to 2½ per cent of the blood volume

In conclusion, he addressed himself to the question as to when vaccine therapy ought to be employed Obviously it ought to be applied in incipient infections and localized infections At present, people with septic fingers and septic wounds went to the casualty department, where surgical methods were employed of opening up the wound and antiseptics were used So far as he knew, there was no casualty department using *vaccine therapy and he* humorously suggested that a decree should be issued by the Ministry of Health that vaccines be used in such case Another kind of case which awaited vaccine therapy was that of long and grave infections, these cases were treated so far as he knew only by the expectant method Those in charge did not want the responsibility of testing *vaccine therapy or immunotherapy but they were cases* which required all the skill that could possibly be brought to bear upon them

Discussion

Professor John Eyre thought that Sir Almroth Wright had placed rather too much stress on the action of the wandering leucocytes The antibodies in the serum still had their work to do in spite of the prominence now given to leucocytic action, and many of Sir Almroth Wright's experiments were explicable only on the ground of an excess of bacteriolysin as well as an excess of leucocytes In pneumonia, although the phagocytic power of leucocytes was increased, the large volume of antibody (pneumolysin) occurred in the blood stream after the leucocytes had *apparently been destroyed, the crisis then ensued* and the condition improved

Dr H H Mills, speaking as a general physician said that an increased number of people came in the autumn or beginning of winter for a dose of anticatarrhal vaccine Questions of minute pathology were, of course impossible for a general physician, but the method he had adopted was one which was suggested to him by Lord Balfour who took a very great interest in medicine—namely to use a mixed vaccine, so that one or other constituent might possibly hit the "bull's eye" The fact that people came regularly for this anticatarrhal vaccine was he thought some evidence that it had value The question of localizing the particular organism was often very difficult but from the clinical point of view this work was only in its beginning, and a therapeutic agent most valuable from the general physician's point of view might emerge

Dr Geoffrey Marshall remarked that vaccines had come to be used on an enormous scale, there was no doubt that the absence of enteric fever must be attributed to vaccine inoculation Most clinicians believed in their use not only in prophylaxis, but in combating localized infections, such as boils Vaccines had also been used largely in the treatment of toxaemic disease Their employment in such a condition as pulmonary tuberculosis had waxed and waned, on the whole, the evidence of the value of tuberculin in this regard was very dubious, and he believed the same could be said of vaccine treatment in all toxaemic diseases He personally thought that tuberculin had been tried, and had failed, this was borne out by the fact that there were, he believed, something like fifty-seven different varieties of tuberculin, but in prophylaxis the value of vaccines was unquestionable

Mr Harold Dodd asked for an opinion as to what help could be afforded by vaccine therapy in such an anxious and frequent case as that of a pricked finger with septicaemia following He had found difficulty in knowing when to apply the different agents He had seen mercurochrome give very good results in some cases of infection

Dr C W Buckley said he had used an anticatarrhal vaccine, prepared in St Mary's Hospital laboratories, it had seemed to him in a given patient to yield at first a good result The patient came back for another inoculation the second winter, which was perhaps less effective, but on the third occasion the inoculation seemed to set up a negative phase, and the vaccine appeared to be valueless The same experience had occurred in the case of boils, some patients were specially susceptible to that kind of infection, and he had treated them by inoculation with good results On the second outbreak the inoculation was less effective, and on the third, which might occur five or six years after the first, the vaccine appeared to have no value He had found the same order of results follow the injection of manganese He had been using vaccines for infective arthritis, the custom, when he started this treatment, was to give very large initial doses, 5,000,000 or more, and the results were variable, and not very convincing But after watching these cases in hospital, he gradually got to the stage at which he started with quite a small dose of 500,000, and found the results much better

Sir William Willcox maintained that the work which Sir Almroth Wright had done had opened up a new field in medicine Largely in consequence of it, a number of diseases had come to be looked upon really as symptoms—as evidence of some toxic condition in the body It was very largely due to Wright's work that the view of medicine in this country had changed so enormously during the past twenty years There were certain conditions in which the body was sensitized, and in which vaccines should not be used One of these was exophthalmic goitre, where serious results might follow from the giving of vaccines Gout was another example The utmost care should be taken with regard to the use of vaccines in asthma He thought it might be accepted that vaccines had a profoundly beneficial value in prophylaxis, the statistics for typhoid fever, plague, and cholera proved that One very important thing to remember before using vaccines in any case of illness was to discover any focus of infection in the body where organisms might be lying, which focus was not readily accessible to these bactericidal fluids If there was such a focus present, the vaccines would do no good at all He never attempted to use a vaccine in arthritis unless a most complete routine examination had been made for the presence of any focus of infection in the body He required to be satisfied, not only by laboratory experiments, but by the experience of his colleagues in charge of nose and throat cases, or dental cases, or gynaecological cases, that there was no localized focus After any focus of infection had been dealt with, vaccines did good He began generally with a small dose (250,000) until he found whether the patient could tolerate bigger doses It was very easy to overdose patients and make them worse

Mr E B Waggett asked whether in a case of chronic focal infection there was any value in using vaccines before operation His own feeling was that it was better to get rid of the focal sepsis first He had seen a serious case of dental sepsis, with certain mental effects, in which a minute dose of vaccine precipitated a great mental disturbance That was before the extraction of the teeth; three or four weeks later the teeth were extracted without any ill effect

Professor A Fleming discussed the subject of vaccines against colds A large group of people did not catch colds except once in a while, these were very well immunized as it was, and it seemed a pity to give them vaccines The second group, not an inconsiderable one, consisted of people with chronic infections of the respiratory tract, sometimes what they called a cold was merely an exacerbation of the existing infection, and that type of patient might be inoculated There was a third group in whom no chronic infection could be found, but who were still subject to colds, there again it was possible to increase their immunity so that colds occurred less frequently Naturally, complete immunity was not forthcoming There was considerable evidence indicating that the common cold was caused by a filter-passing organism, and that the organisms found in colds were secondary, so that vaccination was being conducted only against the secondary infection

Dr Walter Broadbent said that he never gave these vaccines against colds to patients before 5 o'clock in the afternoon, because he hoped that thus the negative phase would develop when the patient was in bed Some disasters had occurred when the vaccines were given in the morning and the patients had gone out in the evening

Mr Zachary Cope commented on the use of vaccines from the point of view of the surgeon, an incision was one of the most valuable methods of getting rid of an infection In very many parts of the body the products of bacterial infection accumulated, and very frequently, if they were let out, the greatest good resulted He asked what vaccine should be given in a particular case It was bound to be a method of trial and error when there were many micro-organisms at work He did not think Sir Almroth Wright would countenance trial and error by the clinician who was not at work in the laboratory, but since there was a non-specific immunization as well as a specific immunization, it would be interesting to know whether they were justified in giving any vaccine for any disease, and to know also what amount was specific and what amount non-specific Many practitioners used protein therapy to cure various conditions The question of antiseptics which Sir Almroth Wright had raised was a very big one Surgeons never injected carbolic acid into the blood, nor would dream of doing it, but there were many now who said that mercurochrome and other substances were really valuable in some of these diseases If they were valuable, they ought to be used, he himself had not employed them because he was awaiting Sir Almroth Wright's opinion

The President (Dr R A Young) shared Dr Geoffrey Marshall's fear of tuberculin in medical cases, yet he was impressed with the fact that tuberculin was used by surgical colleagues in the localized forms of tuberculosis He had noted the failure of vaccines in certain respiratory infections, especially bronchial infections, and also in cases of lung abscess only incompletely drained

Sir Almroth Wright said, in reply to the point made by Dr Buckley about patients being well the first year and less well subsequently, that he could conceive of a man developing the power of dissolving microbes The sensitiveness must obviously depend in part on whether the microbe was dissolved He again laid stress on the necessity for laboratory experiment Was there any laboratory experiment in favour of mercurochrome, the virtues of which had been mentioned by one or two speakers? He thought not One speaker had said that the use of vaccines in prophylaxis was excellent, but in treatment was valueless But there were all grades between a septicaemia and a small local infection it would seem that if a vaccine was good for prophylaxis it must be good for small local infections also A remark about Koch led Sir Almroth Wright to observe that "Koch was a very great man, but about the worst clinician—the worst doctor—it was possible to conceive"

TREATMENT OF APPENDICITIS

At the opening meeting of the Section of Surgery of the Royal Academy of Medicine in Ireland the president, Mr R Atkinson Stoney, read a paper on appendicitis and its treatment based on a series of 209 cases operated on during the last 6½ years

Mr Stoney said that these cases were consecutive and unchosen, all the patients seen being operated on The conditions were as follows chronic or clapping 64 (30 per cent) simple acute, 84 (40 per cent), gangrenous 17 (8 per cent), abscess, 19 (9 per cent) perforation or abscess with peritonitis, 7 (3 per cent) very acute (frequently gangrenous) with peritonitis 18 (9 per cent) In the last two categories, by peritonitis was meant generalized peritonitis This did not imply necessarily pus present throughout the whole peritoneal cavity fortunately a rare condition but pus or turbid and usually foul smelling fluid lying free in the peritoneal cavity without adhesions or localization Four patients had died two having very acute peritonitis and one a perforation or abscess with peritonitis These three patients were extremely ill with high temperature rapid pulse, and cyanosis they were moribund at the time of operation and died within a few hours The fourth patient, with an abscess did well for a few days but died on the seventh day owing to *broncho-pneumonia By incision through* the outer border of the rectus the use of tube drainage and of modified bipp (iodoform 2 bismuth 1, and soft vaseline 15 parts), danger of spreading the infection is prevented in all cases where there is infection outside the appendix, these procedures being associated with careful packing off of the general peritoneal cavity as the first step after opening the peritoneum Abdominal complications such as paralytic ileus mechanical obstruction, pylephlebitis, subphrenic abscess, and haemorrhage were avoided The only complications in this series comprised a case of pelvic abscess where a pelvic drain was not used and another of persistent sinus where the appendix could not be removed In only six other cases was the appendix left behind, these were all abscess cases The occurrence of enlarged superficial veins in the right iliac fossa was noticed several times, they were always accompanied by the presence of pus either forming or having formed in the neighbourhood of the appendix

Sir William Wheeler thanked the president for having presented definite figures with regard to results Authors had often claimed good results but on close inquiry it was frequently found that the cases had not been accurately followed up He emphasized the pitfalls surrounding acute appendicitis in young children Subacute appendicitis had arisen in one of his cases recently in a young child with threadworms and it should be recollected that thread worms predisposed to definite attacks of catarrhal appendicitis Sir William Wheeler referred to a case of typical cyclical vomiting in a boy aged 10, in whom removal of the appendix brought about a cure He pointed out that in acute cases complicating pregnancy there was a mortality of 77 per cent, according to J B Murphy He had operated on several such cases, and found that the omentum and coils of small intestine were pushed away by the uterus, and there was little chance of suppuration becoming localized The distended veins appeared to invite thrombophlebitis For some time past he had been using the transverse incision for appendicectomy but the incision was dictated by the individual case He recommended a thorough understanding of what Murphy described as offensive and non-offensive pus this, in his opinion, assisted in deciding the question of drainage or non-drainage

Mr Seton Pringle expressed himself as strongly in favour of immediate operation in almost all cases of acute appendicitis He did not consider that the statistics put forward in favour of procrastination were conclusive Some years ago he had analysed the results of 121 acute cases operated on during a period of four years Of these, nine or four were drained so that in the number at least, there was infection not confined to the appendix Of these patients only four had died and the average stay in hospital of the survivors was twenty-eight days Mr Pringle objected strongly to a "time-table" for appendicitis It was not right, in his view, to talk of first second third, and fourth day appendicitis, since the pathological process varied so greatly He classified his cases as early middle and late, he operated on all early cases and on all middle cases immediately, except in those rare instances in which the condition was obviously subsiding As regards late cases, he advocated immediate operation in peritonitis, but frequently postponed operation for a few hours in cases of localized abscess He believed all children should be operated on immediately the diagnosis was made

Mr J L Keegan thought that in difficult cases the most satisfactory incision was a vertical one on the outer side of the rectus, drainage could be reduced to a minimum by a careful toilet of the peritoneum The president's results following the use of bipp were very satisfactory but he personally felt that the use of iodoform in the abdomen was questionable

Dr T G Moorhead said he had been present at many operations in which chronic appendicitis had been diagnosed Sometimes adhesions or other signs of inflammation were present, but not infrequently the appendix appeared normal except that it was either longer or shorter than the average Was an appendix abnormal merely because of unusual length or because it contained faecal matter? If any advance in diagnosis was to be made, it would be necessary to have a definite statement as to what was abnormal in the appendix The symptoms should be carefully correlated with the condition found *and if this was done in a large series of cases, fewer* operations would be performed merely for mild recurrent pain in the right iliac fossa

Mr W Doolin declared that he would never introduce bipp into the abdominal cavity, since he was convinced of the defensive power of the peritoneum if left to itself He thought the Ochsner treatment an extremely dangerous one to teach to students He referred to the difficulty of operating in cases of pregnancy, especially during the last two months, the operative mortality in such cases was about 30 per cent and the foetal mortality over 50 per cent In cases of bad suppurative appendicitis he had recently been injecting a 10 per cent solution of mercurochrome into the bowel in none of these had it been necessary to perform a subsequent entero tomy

Mr C J Macauley remarked that apart from paralytic ileus the mortality from acute appendicitis would be almost negligible Some patients survived enterostomy and some did not, but so many got well spontaneously that it was hard to know whether to employ entero tomy or not Secondary enterostomy was often undertaken too late Mr A A McConnell stated that in a series of 100 cases most of which were emergencies the mortality was 7 per cent this was considerably higher than that which the president had reported In these 100 cases there had not been one in which infection of the abdominal wall had occurred and he believed that such infection was extremely rare He thought that some so-called residual abscesses were really pelvic abscesses which had been overlooked

Mr F J Henry referred to the importance of excluding the *small intestine from the operative field and* said he always made a gridiron incision when operating on male patients Appendicitis in the aged was a very insidious disease He had recently seen two patients in whom a condition was found which rendered it difficult to say whether one was dealing with a leaking carcinoma or an appendix abscess Both made uneventful recovery and he had no doubt, were cases of quiet appendicitis He thought that patients with chronic pain in the right iliac fossa should not be operated on without great reluctance, and only after a complete examination Chronic appendicitis *per se* was an extremely rare disease when an operation for it was undertaken a complete laparotomy should be performed

The President, in reply agreed that the difficulty of diagnosis in children was very great the danger of operation was also great, chiefly owing to the fact that children had little omentum In his series he had not had one case of paralytic ileus He did not like injecting fluid into the abdomen unless it came out and therefore never used a syringe till a week after an operation

Reviews.

SURGICAL DIAGNOSIS

IN his introduction to the three volumes on *Surgical Diagnosis*[1] by American authors, of which he is the editor, Dr EVARTS GRAHAM strikes a note of truth when he says, "The remarkable developments in the art of operative surgery have not been an unalloyed blessing to humanity, for, because of the very fact that much of the danger and fear has been removed from surgical operations, the new spectre of unnecessary and unwise operations has appeared." This, combined with the general decentralization of surgery, has resulted in the unfortunate fact that often patients are operated upon with too little preliminary study. Dr Graham adopts these arguments as a justification for the appearance of a set of new and comprehensive volumes dealing with a subject that has already, in this country at least, been rather adequately covered. Nevertheless, we feel that these particular books are welcome, although their appeal lies much more in their general excellence and thoroughness of presentation than in the nature of their subject matter.

The list of contributors is an imposing one, containing as it does the names of the leading American surgeons in each branch of the subject, the opinions expressed can therefore be accepted without hesitation as authoritative. In the general scheme a very large amount of attention has been paid to pathology, and, indeed, surgical applied pathology more nearly describes the scope of the work than its actual title. This is all to the good, for, if skilfully handled, pathology should be capable of explaining the symptomatology, and so lead to the diagnosis. As a whole, the books are very informative, "up to the minute," and well written, and the balance between the sections is properly preserved.

Of the individual sections, that on diseases of the liver and gall-bladder has, very appropriately, been written by Dr Graham himself, and, despite the fact that his great reputation upon this subject might have led to an excusable overweighting, it is particularly noticeable that here, as elsewhere, a due concentration, albeit combined with thoroughness, has been maintained, this section, indeed, forms one of the best summaries of the present state of our knowledge of liver function and its tests, and of gall-bladder pathology, that we have yet seen. The section upon infections of the hand is by Kanavel, than whom no better exponent of the subject could be found. Lesions of the spinal column are in the capable hands of Hibbs. Adson of the Mayo Clinic writes on diseases of the spinal cord, a section that is, if such a thing be possible, even better illustrated than the rest of the book. The chapter on the skull, and the brain and its membranes is by Dandy, here again no undue prominence is given to the problems of hydrocephalus, which the author's well-known work upon the subject might have led us to anticipate. One very stimulating chapter is devoted to a discussion of the uses of surgery in conditions involving the sympathetic nervous system, and, strangely enough, another small one to osteopsathyrosis.

It is impossible, however, in a short review, to take each section separately, they are of a uniform excellence, and there is little to criticize in any of them. A bibliography at the end of each chapter is sufficiently extensive to guide those who wish to refer to particular articles, while in addition to the usual index at the end of each volume there is a separate small index volume, which should save much annoyance when references have to be searched for. The publishers have also very wisely placed a small contents table on the covers, a plan which might well be adopted in all multi-volume works. We are used to copious illustrations in books of American origin, and these volumes are no exception, photographs and radiograms, as well as the simple line drawings, have reproduced well, and despite their profusion there are few, if any, redundant or meaningless illustrations. The paper is good, and the type pleasant, while the binding has the strength necessary in a book of reference. Altogether this work can be very heartily recommended, since it presents the state of modern surgical knowledge in a very fair an unbiased manner, it will especially appeal to those who believe that surgery is a science as well as an art.

[1] *Surgical Diagnosis.* By American Authors. Edited by Evarts Ambrose Graham, M.D. Vols. i., ii., iii., and General Index. Philadelphia and London: W. B. Saunders Company. 1930. (6 × 9½; vol. i., pp. lv + 919, 668 figures; vol. ii., pp. viii + 871, 834 figures; vol. iii., pp. viii + 1014, 446 figures; Index, pp. 155. Set of three volumes and index, £7 10s.)

HAEMATOLOGY

MOST haematologists are familiar with Arneth's counts and pictures, and it is generally accepted that a "shift" to the right or left is fairly constant in different diseased states, though it cannot be regarded as specific for any one, the type of picture may supply an interesting and useful confirmatory sign, but cannot itself be regarded in any way as of special value in diagnosis. The present book is the second volume of Dr ARNETH'S *Die speziellen Blutkrankheiten*[2], the first volume has not been received. Here the author has extended his principle of qualitative analysis and classification of white corpuscles to lymphocytes, and has considered the reactions of this widely varying class of cells to different forms of leukaemia. With this, as with Arneth's previous work, it is impossible to avoid the conclusion that an arbitrary classification of cells much influenced by the personal bias of the observer must be open to serious criticism, its appearance of mathematical accuracy has no significance and may be misleading. Certainly it is a procedure that could not be usefully employed in general routine blood examination. With the best of intentions, the author has used an extensive system of abbreviations, of which the glossary is unfortunately incomplete, so that interpretation of the text and tables is often impossible. Abbreviation and elision could have been directed with advantage to the clinical histories and discussions, which are generally prolix and frequently irrelevant.

In an interesting monograph on *The Volume of the Blood and Plasma*,[3] Drs L. G. ROWNTREE and G. E. BROWN attempt to show the value of the study of the blood volume in clinical medicine, and present the results obtained by the "dye method" which they have used for over six years on more than 1,000 examinations. They claim that "by this method it is possible without injury or harm to the patient to determine the nature and extent of the changes in the volume of the plasma and blood in various diseases, and to ascertain the rôle that these changes play in the symptoms and signs of various diseases and in their course and outcome." The first part of the book is concerned with the technique of the method, and discusses impartially the nature and value and sources of errors, and the various objections which have been raised by other workers in the same field of inquiry. The authors aim at a constant routine method. They use Congo red for the dye, examinations are made in the morning following sleep, the patient supine and fasting, they make an interval of three to six minutes between injection of the dye and collection of the blood, using the same centrifuge, and spinning the same quantity of blood for thirty minutes at 3,000 revolutions a minute, they found in one series of 133 quadruplicate estimations a mean variation from the average value was only 1·5 per cent. of the total blood in the haematocrit tube. They find the method absolutely safe, and after discussing the results obtained by other methods, especially the CO method, they believe that "the dye method is the method of choice and it alone should be used." Protocols are given of estimations of blood and plasma volumes in forty-nine normal men and twenty-five normal women, the subjects are grouped as underweight, standard, and overweight, variations from the standard by more than 10 per cent. not being regarded as abnormal. The mean blood volume per kilo of body weight for all the subjects was 88·6 c.cm., in standard men the mean amount of blood

[2] *Die speziellen Blutkrankheiten.* Band II. Von Dr. Joseph Arneth. Münster i. Westf.: H. Stenderhoff. 1930. (Sup. roy. 8vo, pp. xv + 422, 2 figures. R.M.30.)

[3] *The Volume of the Blood and Plasma.* By Leonard G. Rowntree, M.D., and George E. Brown, M.D. With the technical assistance of Grace M. Roth. Mayo Clinic Monographs. Philadelphia and London: W. B. Saunders Company. 1929. (Post 8vo, pp. 219, 47 tables. 14s. net.)

per square metre of body surface was 3,410 c cm Men have 19 per cent more blood than women, but only 13 per cent more plasma—that is, the cell volume is 6 per cent larger in men than in women Estimations in children are also discussed, generally it is found that infants seem to have blood volumes too large for their weight but too small *for their body surface* The greater portion of the book deals with the application of the dye method to estimation of the blood volume and plasma volume in disease The results are interesting in themselves, and help to explain the pathological conditions and symptom observed As might be expected, wide variations of value are obtained even by the authors employing their own established method, and it is evident that much more work will be needed before sufficiently constant estimations can be made to warrant the universal adoption of the method as a routine clinical procedure

APHASIA IN CHILDREN

An interesting inquiry into the problems of aphasia is recorded by Dr A W G Ewing in a monograph entitled *Aphasia in Children*[1] Such limitation of the field of investigation has very definite advantages for, as Dr E D Adrian points out in an introduction, there are significant differences between the aphasia of adults and *children the former being due usually to a breakdown of* the machinery set up in infancy for "symbolic thinking and expression," the latter to a failure to set up this machinery In one group of congenitally aphasic children Dr Ewing was able to show, by a series of ingenious tests, that though otherwise normal in their hearing these children were unable to hear some of the higher frequencies, or to distinguish, except when specially trained to do so, one speech sound from another Other patients classed as deaf and dumb were found by these tests to have normal hearing, and with some patients having aphasia not accompanied by deafness, the data elicited by the tests indicated incomplete or arrested development of the central mechanism in the brain but apart from the use of words, normal intelligence Dr Ewing's description of the methods by which he tested these children deserves the close attention of otologists The rest of the work in which together with his own conclusions he presents a critical survey of the literature on aphasia—a remarkable achievement on the part of a non medical man—contains material of fundamental importance to neurologists and those interested in the training of children

MECHANICS OF THE CARDIOVASCULAR SYSTEM

It is difficult to understand why Dr Hauffe in his book on The Heart Pulsation and Movement of the Blood[2] should be so discursive, for his theme is simple and can be expressed in very few words His conception of cardiac rhythmicity has the merit of originality but it is possible that the present-day retreat from materialistic views on biological phenomena may suffice to hurry his theory into obscurity He thinks that we have no grounds for postulating an independent property of rhythmicity in the heart muscle the walls of the primitive vascular tubes are elastic and can be set in rhythmic pulsatile movement given certain conditions of convection currents in the yolk-sac the pulsatile movement originated in this purely mechanical way is continued in that part of the early vascular system which develops into the heart the stimuli to contraction and relaxation being furnished by the vascular pulsations This is the original contribution he makes to the mechanics of the vascular system The rest of his book describes pulsation under purely mechanical conditions and in various parts of the circulatory system The author is most interesting in his treatment of wave motion in liquids and the majority of his readers will be surprised to learn that the waves on the sea depend for their propagation on the changes of air pressure above them, he is less impressive in his treatment of the vascular system on these lines, asserting pulsation to be conditioned by certain relations of the rate of flow through elastic tubes to their diameter The most readily accessible criticism of this theory is supplied by its improbability To obtain the initial rate of flow from the yolk-sac to the embryo necessary to induce pulsation in the vascular spaces implies such a fortuitous combination of circumstances that one would be justified in congratulating a hen which hatched one chicken in her lifetime Again, if the pulsation is at any moment temporarily arrested, as by experimental vagal stimulation, how can it reappear?

In the past too much attention has been focused on the central part of the vascular system to the neglect of peripheral mechanisms, which might be in operation, but Dr Hauffe has gone to the other extreme and ascribed to the heart an inconspicuous though worthy function It would seem difficult to understand how a mechanical system of this kind could be sufficiently adaptable to the fundamental changes in working conditions which obtain when the human body has suddenly to work in the horizontal instead of the normal erect posture for it is utterly opposed to the conception we are accustomed to hold of the heart, as a pump, forcing forward more or less efficiently what blood it receives from the periphery through a variety of agents, not least of which is muscular movement, and suiting itself, by the force and the rate of its contractions, to the constantly varying conditions prevailing

RADIOLOGICAL TECHNIQUE

X-Ray Technology,[3] by H M Terrill and C T Ulrey, is a treatise on the production, measurement, and application of x rays In parts this work is highly technical but even to the reader who is not a physicist it offers a considerable amount of useful information on x-ray apparatus and its uses, and to those practising deep x ray therapy who desire to attain scientific accuracy in the measurement of the quality and quantity of the x ray stream it should prove invaluable

The eleven chapters deal in order with the properties of moving electrons x ray tubes and their practical application high voltage generation, the measurement of voltage current ionization total energy and wave length biological measurement radiography, and x ray analysis In a preface the authors state that their aim has been to present not so much the theoretical as the practical aspects of x ray measurement as encountered by all workers in the x ray laboratory This end they have attained with considerable success on practically every page the x ray worker will find useful information on everyday problem and any difficulties in the text are mitigated for him by the large number of explanatory diagrams A considerable amount of space is allotted to instrumentation and the descriptions of various pieces of apparatus are good especially those in the chapter on x ray tubes

NOTES ON BOOKS

Possession Demoniacal and Other, among Primitive Races in Antiquity the Middle Ages and Modern Times is a translation of Professor Oesterreich's work published in 1921 which is a veritable store of information on this interesting subject from the dawn of history until the present time The first of the two parts of the volume deals with the nature of the state of possession and the second and much the longer with its geographical distribution throughout the world and the age and its importance from the standpoint of religious psychology The history of religion provides many examples of possession but these fade away before the advance of a high standard of civilization The subjective state of those regarded as possessed may be one of somnambulism or on the other hand may be lucid—namely with consciousness of their condition. With the passing of belief in demoniacal possession by the souls of the dead who are no longer ha

PREPARATIONS AND APPLIANCES

A NEW BED DESK

Sir Arnold Lawson, F R C S, writes

It is common knowledge that the usual methods adopted by those who wish to read and write in bed are scientifically bad and often injurious to the eyes Further, it is generally appreciated that the discomfort engendered after a time, even when well propped up by pillows, makes both reading and writing, and especially the latter, only possible for a very limited period So far as I am aware nobody has hitherto found a means of dealing effectively with the trouble In both reading and writing the chief difficulty lies in securing a steady support for the book or writing pad at a convenient angle, which must be varied according to the position of the head and shoulders when propped up on cushions or pillows In addition, so far as writing is concerned, a support is required for the right arm and hand, for writing without such support is very difficult and soon becomes extremely fatiguing

With the help of Messrs Theodore Hamblin, Ltd, of 15, Wigmore Street, I have designed a bed reading and writing desk, which does away with faulty and uncomfortable attitudes, and makes reading and writing in bed as easy as when sitting in an armchair or at a table

I hope that this desk will prove to be a very great comfort not only to invalids and to those who are of necessity confined for a period to bed, but also to that very large section of the community which habitually "reads itself to sleep"

The main feature of the design (which is simple enough) is a stout light board of suitable height and breadth, which is shaped elliptically below in order to fit into the body, the right side of the ellipse being lengthened to form a slightly curved tail, which runs away behind the body and rests with its lower edge on the bed The board thus fits the body as the patient reclines propped up by pillows, the tail of the board forming a support for the right arm of the patient This is shown quite clearly in the illustrations (Figs 1 and 2), which are from drawings of the desk in actual use The necessary support for the board is furnished in an equally simple fashion in two ways On the right side there is a double sliding arrangement, which is clamped by a screw easy to reach and to manipulate This slide regulates the angle at which the board is supported, and at the same time affords a horizontal bearing along the bed, no matter at what angle the board may be clamped, keeping the board absolutely secure and fixed On the opposite side of the board there is a non sliding support, also clamped by a screw This support projects from the board at an angle easily regulated by the patient, so that its lower end rests comfortably on the left side of the bed The object of this second support is to counteract the tendency of the board to be pushed over to the left by the pressure of the right arm when writing and to give extra stability to the board when it is supporting a book

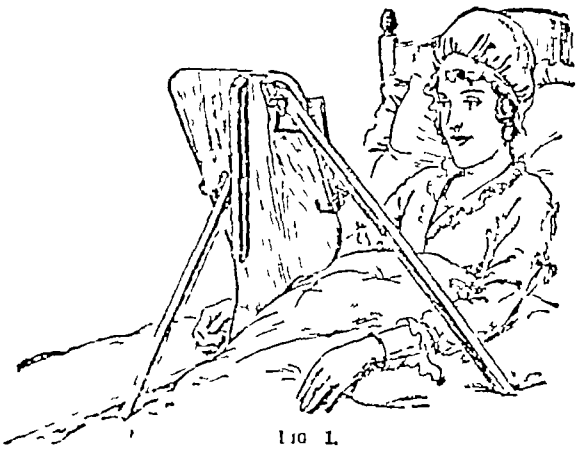

Fig 1.

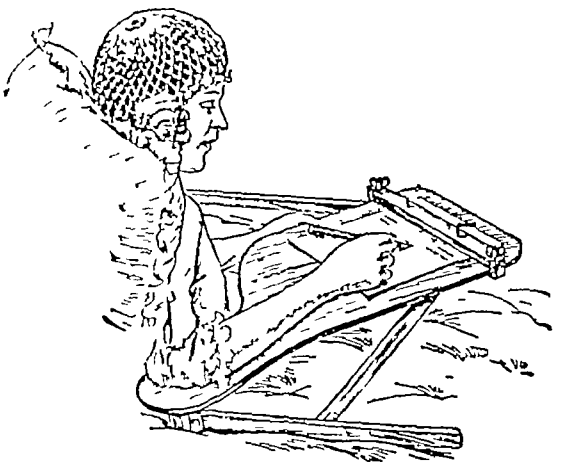

Fig 2.

An important feature is the portability of the bed desk The fact that it can be folded up flat and put away after use is a great convenience in a sick room where space is valuable, and the whole thing can be erected and folded up again by the patient with little effort Figure 3 shows the back of the desk when folded up

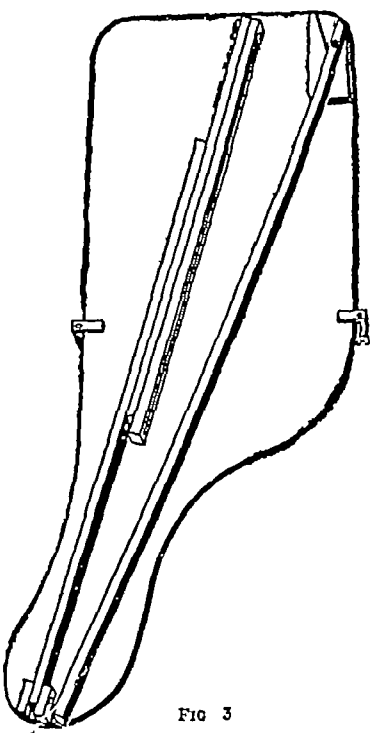

Fig 3

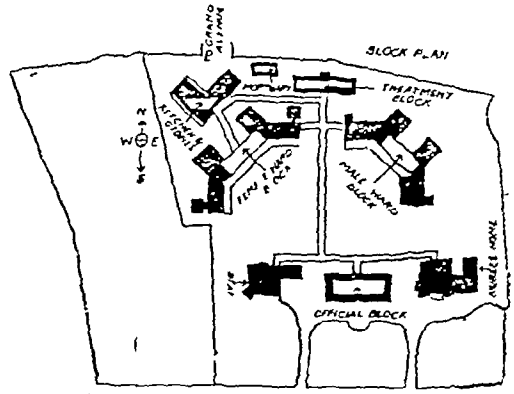
The bed desk has been very well made by Messrs Hamblin, who have patented it, and have registered for it the name of "The Kangaroo" Bed Desk, because it "supports itself by its tail"

*** We have tried this simple and ingenious appliance, in bed and on a couch, and in our opinion it fulfils the claims made by the inventor Both for reading and for writing Sir Arnold Lawson's bed desk should prove a boon to invalids The price, we understand, is 18s 6d.—Ed, *B M J*

WOODSIDE NERVE HOSPITAL

THE NEW ST LUKE'S



Some of the old foundations, established for the care and shelter of the mentally disordered, are showing in these days a ready adaptability to the modern spirit in psychiatric medicine. Only a few months ago we described the removal of Bethlem Hospital into rural Kent where its new buildings incorporate the most humane and progressive ideas, and now it is the turn of St Luke's, which was founded in the middle of the eighteenth century to take in some of the poor wretches for whom Bethlem, then standing on the other side of Moorfields, could not find accommodation. Later on St Luke's removed into Old Street, a site which it had to relinquish in 1916, and since then its work has been in effect suspended until certain new developments should be complete, one in Buckinghamshire and another in Highgate, whereby this charity, still maintaining its traditions and ideals, could re-interpret them in the light of modern ideas of care and treatment. One of these developments is the planning on the northern heights of London of a nursing home and clinic for functional nervous and kindred disorders. During the past two years there has been quietly building on Muswell Hill, overlooking Highgate Wood, and not more than half an hour from the city, a private hospital where it is intended to apply the most rational and scientific treatment, in the hands of a specially trained medical and nursing staff. The Woodside Nerve Hospital has been completed without any blare of trumpets or public appeal. The committee of governors of St Luke's, headed by Lord Blanesburgh have proceeded on the unusual lines of "no publicity until there is something to show."

Development of the Scheme

It will be recalled that it was under the auspices of St Luke's seven years ago that two small wards for the treatment of functional disorders of the nervous system were established in the Neurological Department of the Middlesex Hospital. The patients in these wards have been treated by the medical staff of St Luke's and attended by St Luke's nurses. This departure was viewed at first doubtfully in some quarters and many looked askance at any association of cases which might be mental or borderline with a general hospital. But although the experiment has been amply justified, the inadequacy, or, indeed, the absence, of facilities for treatment has, however, remained, and there must be very many cases, beginning as perfectly curable nervous disorder, which, in the absence of appropriate treatment, have gone on gradually to a hopeless condition. The new hospital, accommodating 50 patients, is to be devoted exclusively to treatment of these disorders as far as possible in their early stages, and it is felt that patients of the educated class will especially appreciate the value of the rest and recreation here procurable. It is not intended to admit cases of insanity or mental deficiency or cases of a kind likely to cause annoyance to other patients.

Structure of the New Hospital

Our representative was taken round the new hospital by Dr R. Withers Gilmour, physician in charge and lecturer in psychiatry at Middlesex Hospital, whose influence is shown in the many original details of design and arrangement. Privacy, a pleasant situation, and spacious grounds have been provided, and although London building is creeping up these northern hills hardly anywhere is the institution overlooked by neighbouring houses. The institution consists, in the first place of an administrative block, a charming piece of modern architecture having on one side an older house which is to serve as a nurses' home and on the other a house which will furnish quarters for the matron, for the deputy physician in charge and for the domestic staff. The administrative block consists of several offices, a handsome committee room and also the nucleus of an out-patient department. Beyond are the male and female ward blocks arranged so as to form almost a semicircle facing south and beyond these again is the treatment block, a two-floor building, and another block serving as kitchen and stores. The chief architectural feature which catches the eye in the general view is the long covered ways connecting the buildings. These with their red tiles are very cheerful cloisters indeed. Each ward block consists of two floors, and each floor, on the women's side, comprises two four-bed wards and seven single-bed wards, and on the men's side, two three-bed wards and four single-bed wards. Thus thirty women patients and twenty men can be accommodated. On each floor there is a private and a general sitting room, a dining room, and other apartments including examination and isolation rooms. Every ward, upstairs and down, opens directly on to covered verandahs, wide enough to leave ample space for walking even when the beds have all been wheeled out into the sunshine. Hot and cold water is laid on to every room, the provision of baths is abundant, and many little devices with regard to furnishing, lighting, and fitment have been thought out in a way to add to the patients' comfort and to the convenient running of the institution.

WOODSIDE NERVE HOSPITAL, MUSWELL HILL.

The treatment block contains provision for hydrotherapy, massage, light treatment, and electrotherapy, including diathermy. All the appliances are of the latest type. In this block also is a dispensary, a room for dental surgery, an x-ray room, with dark room attached and a room which could be used for "occupation therapy." Here also are three laboratories, well lighted and with good bench accommodation, where routine pathological testing is done, and where a certain amount of original research may be carried out. The kitchen block, again is spacious and adequate and underneath are the boilers which operate the low pressure hot-water heating system and the domestic supply to all the buildings.

Financial Provision

St Luke's Foundation has borne the capital expenditure of building and equipment, but the current expenses of running the institution must be met by the patients themselves according to their means. The average charge cannot yet be precisely estimated. A weekly minimum of 5½ guineas is tentatively mentioned (apart from special charges for private rooms) to be paid by those whose circumstances appear to warrant it, but at the same time every effort will be made, by means of reductions granted at the discretion of the committee of governors, to make the hospital available to the less fortunate and any information or expression of opinion on this point by the patient's doctor will strengthen the application and avoid delay. Practitioners will be welcomed if they desire to visit their patients at the hospital and carry on their treatment there in consultation with the physician in charge, the fees for such attendance being a matter of private arrangement between the doctor and the patient. In addition to the physician in charge (Dr Gilmour) and the deputy physician (Dr Lawrie), there are a dental surgeon and a radiologist and the institution has a distinguished honorary consulting and visiting staff.

The hospital is to have the honour of a royal opening by H.H. Princess Helena Victoria, on November 6th.

British Medical Journal.

SATURDAY, NOVEMBER 1ST, 1930

THE PANEL CONFERENCE

The annual conference of Local Medical and Panel Committees was held last week in the Great Hall of the British Medical Association, and a full account of the proceedings will be found in the *Supplement* to our present issue. These proceedings were shorter than usual, and the agenda comprised a much smaller number of items relating to what may be regarded as minor technical matters than has generally been the case. Two questions of very great importance, however, came under discussion—namely, the method by which insured persons are to be permitted to change their doctor, and the suggested extension of the national health insurance system to include the dependants of insured persons. Both these questions are, of course, of great interest to most members of the medical profession, and not merely to those who are engaged in the present insurance service. They should therefore be understood and considered by all.

In the earlier years of national health insurance, apart from the death, retirement, or removal of a practitioner, or the departure of the insured person to another district, the insured person could change his doctor only at fixed dates, and then only by giving a month's notice. If change at any other time were desired the consent of the practitioner on whose list the patient's name appeared had to be obtained. Later, on strong representations from the Insurance Acts Committee on behalf of the profession, these restrictions were abolished, and free choice of doctor at any time was allowed by the simple process of presenting the insured person's "medical card" to another practitioner for acceptance. Some three years ago, again, this method was modified by the interposition of a fortnight's delay. The insured person has now to give that short notice to the Insurance Committee of his intention to make a change. The notice may be given at any time, and the change may be made without notice if the consent of the attending practitioner be obtained. It is not clear that this modification has effected any marked alteration in the number of changes of doctor made by insured persons, or that it has had any other practical advantage. The Minister of Health is now suggesting, at the behest of the Consultative Council of Approved Societies, and of certain administrative departments, that there should be a return to the earliest method, the fixed dates being the first day of each quarter, and the notice required being one month.

The ostensible reasons leading up to this suggestion are that the approved societies have been naturally anxious about the greatly increased claims for cash sickness benefit which have been made over the last four or five years, that they have formed the opinion (erroneously, we believe) that a material element in bringing about this increase has been a certain slackness of certification on the part of doctors who feared lest by refusing certificates of incapacity they might lose their patients, and the families of such patients, to other practitioners who would view the position less strictly, and that a considerable restriction of the patient's right to make a change would remedy this state of affairs. The Insurance Acts Committee and the Panel Conference, while wishing to give full consideration and weight to the Minister's suggestion, are quite unable to accept either the premisses or the conclusion of this argument. They reply that it is of great importance, in the interest of insured persons, that the relation between doctor and patient in insurance practice should be differentiated as little as possible from that which obtains in private practice, that a return to something like the old conditions would tend to create a vested interest in patients and to make less easy the establishment of younger practitioners in practice, and that it would fail of its object in that practitioners led into any slackness of certification by the alleged motive form but an insignificant element in connexion with claims for sickness benefit, and that in so far as they are a factor at all their conduct would not be likely to change because the consummation of their fears would be made slightly less imminent. In this discussion logic appears to be entirely on the one side. It is stated, moreover, that there are definite signs, at least in some areas, that the prevalence of incapacitating illness leading to sickness benefit claims is now less than it has been for some years. This would seem to indicate the desirability for a pause before the panic imposition of a more than doubtful and possibly dangerous remedy.

With regard to the other question—the inclusion of the dependants of insured persons in a national health insurance scheme—it is important that this should be viewed in its right perspective and proportions. What the Conference and other bodies of the profession have stated is not that "the time is now ripe for the inclusion of the dependants of insured persons," but that the time is ripe for the medical profession to ask for such inclusion. The appropriate time for such extention of medical benefit must naturally be conditioned by the exigencies of politics and of finance, and therefore does not at present seem likely to be immediate. This cannot be for the medical profession to determine, but what is at once opportune and significant is that the profession should now draw attention to the need for the fuller provision of medical advice and treatment for these persons, and should urge that this provision ought to be made through the machinery of a compulsory contributory insurance scheme, and not by any other and less satisfactory method, and that it should take its appropriate place as part of a carefully considered plan for giving a complete medical service on a national scale to those members of the community who are not in a position to provide independently what is needed. Suggestions for a general medical service for the nation on these lines have recently been made by the British Medical Association, and, with few exceptions, have been received very favourably by those who are interested in the matter. It is important to note that all the really representative bodies of the organized medical profession have now emphatically endorsed the opinion that the need is real, that the principles on which action should proceed are clear, and that, by whatever steps and in whatever order such action is taken, the final plan of full provision should be always in mind, so that nothing of a tentative or temporary nature should be done in such a way as to militate against or make more difficult the proper ultimate development.

"TONSILS AND ADENOIDS"

An elaborate survey of two large groups of children has been made by Dr Albert Kaiser, and the results were published a few weeks ago in the *Journal of the American Medical Association*.[1] The children in one group had been submitted to tonsillectomy and in the other the operation had been recommended but not performed. The second group therefore affords a fairly reliable control for comparing the late effects, and the numbers are large enough to give accurate percentages and eliminate the errors due to chance in a small series of cases. Each group contained 2 200 children. The paper is interesting not merely on account of the statistical results obtained, which reveal nothing very startling, but more because it shows a realization that when no less than 50 per cent of the children in some communities have been submitted to this operation it is time to pause and take stock of the position. The point which the craze for this operation has reached is shown by the number of perfectly healthy persons who present themselves at hospital because they are unable to obtain employment with their tonsils *in situ*. It appears from the remarks of Dr Kaiser in closing the discussion which followed his paper that this manifestation of officious zeal is common also in the United States. It would not be disputed by any unprejudiced judge that in individual cases, well selected, there is no minor operation which confers more benefit by improving the general health and by relieving the child from such recurrent infections such as tonsillitis, cervical adenitis and otitis media. Such an admission, however, implies that these operations are performed only when really necessary, and are based on reasonable indications.

If statistics have any value at all, the figures of Dr Kaiser show that over a period of ten years, some of the benefits of the operation become less evident after the lapse of a few years from the date of its performance. They show however that during these ten years the children who have had their tonsils removed are less liable to sore throats, to scarlet fever, to diphtheria, to cervical adenitis and to first attacks of rheumatism. Acute coryza and otitis media are lessened in incidence for the first three years after the operation, but over a period of ten years are not much influenced, and recurrent attacks of rheumatism are not improved. These results show that in a large group of well selected cases the benefits which are familiar in individual cases maintain a fair average and although the indications are not definitely stated it may be assumed that they are fairly well known. There is however a group of cases in which the operation in children does not yield the satisfactory result expected and there is another point which the investigations of Dr Kaiser touch upon but leave unsettled. They do not show how much of the good resulting from the operation is due to removal of adenoids and how much to removal of tonsils, though they do show that incomplete tonsillectomies do not offer the same protection as complete removal. It is a frequent observation that when tonsils and adenoids are removed in small children under 5 years of age there is a tendency for the adenoids to recur during the next few years, and a secondary removal may be required. In these children the symptoms of nasal obstruction, the recurrent colds and otitis media are chiefly due to adenoids and whatever the function of this lymphoid tissue may be at this period of life, there can be no doubt that the child has need of it. In consequence, if there is a complete tonsillectomy as well as removal of adenoids, the lack of this tissue leads to a recurrence of adenoids, whereas if harmless tonsils are left they protect the child against this deficiency and against the regrowth of adenoids.

The conclusion seems to be that the pendulum is swinging towards a stricter selection of cases on the lines indicated by Dr Kaiser and that in small children removal of adenoids alone is usually sufficient. In a good proportion of such children the tonsils will not require to be removed at all, but when it is necessary a better result is obtained by postponing tonsillectomy until the child is bigger. The evil resulting from incomplete tonsillectomies performed in young children has been conspicuous in recent years, and difficult secondary dissections are frequent. Such patients would have been better served by a simple removal of adenoids in the first instance and saved from some slight hazard.

[1] *Journ. Amer. Med. Assoc.* September 20th 1930. Results of Tonsillectomy. A Comparative Study of Twenty-two Hundred Tonsillectomized Children with an Equal Number of Controls Three and Ten Years after Operation. By Albert D. Kaiser, M.D.

THE SLEEP HABIT IN INFANCY

DR H. C. CAMERON'S admirable paper on the disorders of sleep in childhood, delivered at the Winnipeg Annual Meeting, is printed in our opening pages this week. Nowadays, the value of training in the development of the placid infant is fully appreciated but often a conscientious mother fails in the management of her child, while a more casual or stupid woman will get better results. The reason is, of course, that the more intelligent type of woman who has attempted to qualify herself for motherhood by assimilating modern theories of child management, is apt to be over anxious in her efforts to apply them as Dr Cameron points out her agitation, transmitted to the child, may react unfavourably upon it and a vicious circle is rapidly established, which may persist indefinitely. His suggestion that the best place for the infant is in contact with the mother's back, so that her face and eyes are directed away from the child, and her hands can be occupied with other activities, has unfortunately a limited application. The hours during which a badly trained infant may indulge in crying and insomnia are often in the early evening, when the mother has turned her attention to other aspects of her life. To retire to the nursery to sit in close proximity to the child is to teach him never to sleep unless his mother is present. It would seem that a better plan lies in training the mother. It is surprising how few are the women who can treat their first child with tranquillity yet the mother is presumably an intelligent and reasonable person, and can be trained much more rapidly than a previously mismanaged infant. Schools of motherhood are sometimes advocated and if they ever come into existence their motto should be "Æquanimitas." Dr Cameron comments on the absence of restlessness among infants in institutions here they receive all the care necessary without the constant stimulation of maternal anxiety. He insists that it is through the mother and the nurse that influence can be brought to bear on the restless child, the responsibility of course must lie primarily with the maternity nurse. It is not enough that she should inspire confidence in her own work. She must be capable of transmitting self-confidence to the mother, or her very efficiency will make her departure at the end of the puerperium a more serious break. For mothers appreciate the essential robustness of a baby the mere process of being born—of being thrust forcibly through a narrow bony channel—is one to which few would care to subject a small infant. Yet Nature does not

hesitate to enforce it, and the child, far from being injured, in the majority of cases is not even ill If a mother can be made to realize that a normal infant is surprisingly difficult to kill, she will enter on the experiment of rearing one with fewer misgivings The need of drugs for the well-managed infant is rare, but where a habit of restlessness has been formed Dr Cameron advises the use of chloral until the sleep rhythm has been restored He reminds us, however, that persistent crying may have a foundation in physical discomfort It is not at all easy for the inexperienced mother to distinguish between colic and choler in her child Here again the nurse is the important tutor, she must teach her patient to look for signs of illness in the infant, other than crying, to observe the stools, to be on the watch for aerophagy, and to notice catarrhal obstruction of the nose, which may interfere with suction while taking the breast The few cases in which unrest is the result of persistent pain from such conditions as otitis media syphilitic periostitis, and the subperiosteal haemorrhages of scurvy call for the early intervention of the doctor, but if the mother has trained herself to habitual calmness she is more likely to detect a serious condition early, and less liable to set up the cry of "wolf" when the child is in no danger

A "SCHOOL OF HEALTH'

In speaking to a vote of thanks to Professor A W Sheen for his address from the chair of the Hunterian Society last week, Dr W Langdon Brown conjectured that somewhere about 2030 A D a diligent student of the past would discover that the "school of health," a creation of the early twenty-first century, had been forecast a hundred years earlier by an eminent surgeon of Cardiff The "school of health," as Professor Sheen described it in his forward-looking address, would be an entirely new feature in the life of the community, a great self-contained organization devoting itself to research and practice in all matters pertaining to health, demonstrating every measure for the promotion of fitness and disease prevention, and creating by the evidence of its work a health conscience in the community He first pointed out the dire toll taken by disease and unfitness The general lowering of infant mortality had involved the survival of defectives, no steps were taken to prevent their propagation, and this class did not practise birth control There was an enormous increase in poor relief, itself an index of unfitness Unfortunately, morbidity statistics which might be compiled from national health insurance records were not available, but there was undoubtedly a great increase in claims for sickness benefit Proceeding to describe in greater particularity the "school of health," Professor Sheen said that it would be a voluntary institution, free from outside control He saw it situated in a great health park on the uplands of some southern county, its buildings perfectly designed for its purpose, but allowing of ready expansion and convertibility The staff would be chiefly whole-time people, including not only members of the medical profession, but eugenists, sociologists, anthropologists, chemists, physicists, architects, engineers, experts in child study and education, all working for human welfare in their several provinces The work of the school he discussed under several headings One of the departments, as he saw it, would be entrusted with the furtherance of eugenic marriage by way of education of the individual Part of the school's work would be to look after expectant mothers and furnish the necessary education in infant care and welfare Child life and education would be one of the great interests of the school, for in the speaker's view measures of health and education were never to be dissociated, and the two Ministries might well be rolled into one A directed child education would be one of the functions of the school, and he strongly maintained that such education could be directed to vocation without any sacrifice of its value in forming character The school would contain a health clinic, as distinct from a clinic for disease, but curative medicine would also have its place, and there would be an associated hospital, but a hospital of a new kind In selecting some of its patients preference would be given to those in the early stages of a malady—that is to say, those who were dealt with in the out-patient rooms of the ordinary hospital would be in-patients here The hospital also would be a research institution, and the first question asked about each case would be, "Why is it, and how can it be prevented?" A psychiatric clinic would form another branch He gave an impressive list of subjects which the school would study environmental conditions, the distribution of population, the lay-out of estates urban and rural life, clothing, climate, and air, sanitary services, food, drink, and drugs, occupational and recreational activities, psychology, and many more The school would be a kind of health clearing-house, a place where health information would be received from every source, new things sifted, proved, accepted, or rejected It would have the greatest health library in the world Members of its staff would travel far and wide to give and receive information The school would receive students, again eugenically selected, none being able to claim admission by any right Some of them would pay their way, others would pay nothing, and yet others would be paid The first students would be graduates, but later he hoped that ordinary medical students would learn here the great lessons of preventive medicine It was almost pathetic to reflect to how small an extent the resolution of the General Medical Council that training in preventive medicine should permeate the whole curriculum had been fulfilled His school would involve no interference with present-day medical training in this country, which he regarded as the best in the world But he gave an outline of the ideal curriculum, in which, for one thing, the study of structure and function in health would go on side by side with their study in disease Human physiology and anatomy would be studied as applied subjects, and their teachers would be men with a high degree of clinical and pathological knowledge, keeping in touch with modern advances Discussion was called for at the close of the address, but little or none was forthcoming, the members present probably feeling that after Professor Sheen's eloquence any small talk would be an anticlimax

IMMUNIZATION AGAINST SNAKE VENOMS

The report for 1929–30 of the Walter and Eliza Hall Institute of Research in Pathology and Medicine, Melbourne, records further progress in the investigation of Australian snake venoms, of which we gave some account on December 7th, 1929 (p 1071) In the experimental production of passive immunity to snake venoms it has been found that monovalent antivenenes are strictly specific, except with the venoms of species closely allied to those used in the preparation of the antivenenes, though even here the degree of non-specificity is very slight With regard to active immunity it has seemed probable that specificity would be less strict, and work has been carried out at the Institute to throw light on this question Six groups of guinea-pigs were immunized each against one of six different venoms, and after some months' treatment the survivors were tested by subcutaneous injection of lethal doses of other venoms It was found that animals immunized by means of a venom of the tiger snake that they were able to withstand subcutaneous injection of fourteen lethal doses of this venom *without* symptoms were also immune to twelve lethal doses of copperhead venom and eighteen lethal doses of grant brown snake venom On the other hand, this treatment afforded no

appreciable protection against the venom of the cobra or of the black snake, and only slight protection against the venom of the common brown snake Guinea pigs immunized to withstand nine lethal doses of copperhead venom showed no appreciable immunity to the venom of the cobra, death adder, black snake, or giant brown snake, but were immune to four lethal doses of tiger snake venom By contrast, guinea pigs immune to only two lethal doses of death adder venom could withstand ten lethal doses of copperhead venom or eight of the venom of the tiger snake Immunity to cobra venom, however, conferred no appreciable immunity to the venom of copperhead, death adder, or tiger snake Finally, animals immunized with daboia venom have no immunity to the venom of cobra, copperhead, death adder, or tiger snake It is worth noting in interpreting these results that the tiger snake and copperhead are more closely allied zoologically than the other elapines studied, though each of the six snakes whose venoms were used for testing represents a separate genus Cobra venom is more akin to that of the Australian elapines, its action being mainly haemorrhagic and neurotoxic, daboia venom is totally different, being viperine in general character It appears, then, that in active immunity against snake venoms specificity is less strict than in passive immunity with univalent serums The degree of specificity seems to be determined by the zoological relation of the reptiles producing the venoms, which may or may not be paralleled by similarity in the toxic constitution" of the venoms, and by that particular toxic action of the venom which is dominant in the species of animal used for the experiments According to this report close species relationship between the reptile supplying the venom used for immunization and the reptile whose venom is used for testing seems to be even more important in determining non specific protection than close similarity of the venoms in their toxic behaviour

METHYL ALCOHOL FOR HOUSEHOLD USE

One of the chief characteristics of the present century is the rapid advance of applied chemistry New compounds are being continuously introduced for commercial and domestic service, and new uses found for substances already known Unfortunately, this rapid progress sometimes results in the risks of wholesale poisoning, for there is a tendency for substances to be introduced for popular use without much attention being paid to their possible, or even their known, toxic properties A recent example of this is reported from America [1] It has been found possible to produce methyl alcohol (CH_3OH) at a very low price from water gas ($CO + H_2$) and hydrogen, and this alcohol is now being introduced as an antifreeze mixture for radiators Methyl alcohol is, however, a volatile cumulative poison The minimal toxic dose undoubtedly varies very greatly for different individuals, and one of its effects is incurable blindness This effect has been reported as having followed doses as small as a teaspoonful, and moreover, both death and blindness have been produced by inhalation of the fumes of methyl alcohol The course taken by the law in attempting to safeguard the health of the community is remarkably erratic The presence of a trace of arsenic in a foodstuff is punished with severity, even in cases where it is nearly impossible for anyone to receive thereby a single therapeutic dose on the other hand, there is remarkably little attention paid to protecting the public from the hazards of the widespread distribution of volatile toxic substances It would appear reasonable to demand that before introducing into household use substances that are probably or certainly toxic, some tests should be made to ascertain the extent of the possible danger

FORMULAE FOR THE NEW PHARMACOPOEIA

The Pharmacy Subcommittee of the Pharmacopoeia Commission has issued a report on certain aspects of the work carried out since its formation in September, 1929 [1] The subcommittee has had under review the pharmacy of certain preparations in the *British Pharmacopoeia*, 1914, referred to it by the Commission, and now presents recommendations relating to some formulae which need alteration While it has not yet completed its work on all the proposed additions to the *Pharmacopoeia*, it suggests some new formulae and will include others in a later report It recommends that in making solid extracts and certain other preparations, the use of industrial methylated spirit should be permitted subject to the regulations of the Board of Customs and Excise In each case the formula should be drawn up for the use of rectified spirit and a note appended stating that "in making this preparation the alcohol may be replaced by industrial methylated spirit diluted so as to be of equivalent alcoholic strength, provided that the statutory regulations governing the use of industrial methylated spirit are observed" In regard to glycerins, the subcommittee recommends that for convenience in manufacture the quantities in the formulae for these preparations should be expressed by weight It recommends the inclusion in the *Pharmacopoeia* of concentrated infusions which, when diluted with seven times their volume of water, represent the fresh infusions In the absence of an instruction to supply the fresh infusion (by adding the word "recens") it should be left to the discretion of the pharmacist to dispense either the fresh infusion or the product obtained by diluting the concentrated preparation No concentrated infusion of digitalis should, however, be included, and the dispensing of fresh infusion should be required A general process for the preparation of a uniform basis for lozenges is given in the report A formula under the name of "unguentum simplex" is recommended as a base for certain of the official ointments which are now made with lard and are accordingly liable to become rancid Wool fat 50 grams, hard paraffin, 100 grams soft paraffin 850 grams Melt together, stir until cold" Recommendations are also made in regard to the formulae for a number of liniments, mixtures, plasters powders, resins, solutions, spirits, syrups and tinctures new formulae are proposed for pilula hydrargyri and oxymel of squill and a general process is described for the preparation of aromatic waters A tincture of ipecacuanha is suggested to take the place of vinum ipecacuanhae, anticipating the deletion of all "wines" from the next edition of the *Pharmacopoeia* In the nature of things many of the subcommittee's recommendations concern pharmacists more than prescribers but the hope is expressed that this report will receive wide circulation among members of the medical profession in order to secure criticisms of the statements made and suggestions for improving the proposed formulae The Pharmacopoeia Commission therefore invites discussion of the report by medical practitioners and welcomes their comments

The Bradshaw Lecture before the Royal College of Surgeons of England will be given by Mr J Herbert Fisher on Thursday, November 13th at 5 p m His subject is 'Ocular muscles movements and judgement'

We regret to record the sudden death at Jerusalem on October 25th of Dr Waldemar M Haffkine C I E, whose work in connexion with the prevention of plague and cholera is well known We hope to publish a biographical notice in an early issue

THE GENESIS OF THE PHYSICIAN'S IDEAL *

BY

THE RIGHT REV HERBERT HENSLEY HENSON, D D,
LORD BISHOP OF DURHAM

WHEN I received the invitation to address you to-day at the beginning of a new session of academic work, I was so sensible of the honour which was done to me that I could not refuse what had been so courteously asked, but when I faced the practical question, What shall be the subject of my address? I found it nowise easy to give a satisfactory answer It was obviously out of my power to speak of anything which lay within the ambit of medical science, for my ignorance would be apparent, and might be even ludicrous The occasion hardly lent itself to a sermon, a form of composition with which indeed I am not wholly unfamiliar, but which might not be as welcome to my audience as it would be convenient to myself Finally I decided to select a subject which could not be wholly without interest to medical students, and which might fairly and even usefully be discussed by one who could not himself lay claim to that description I am going to speak to you on the Genesis of the Physician's Ideal Whether that rather pompous title carries to your minds the meaning which it carries to mine is not certain In any case it will suffice for my purpose, and whatever dubiety belongs to it will be cleared away by the address itself With so much of personal explanation, I betake myself to my duty

Every man's career is mainly determined by *three* factors—his natural capacity, his education, and the circumstances in which he has to play his part in the drama of life To these, which are universally recognized, I propose to add a fourth—namely, the ideal of his employment, which is established, and which perforce he has accepted It is of the last only that I shall speak, though of course it is inseparably linked with the rest When, however, we speak of a professional ideal we are at once arrested by the difficulty that such an ideal is hardly ever authoritatively defined There are professional rules which must be obeyed, professional customs which may not safely be departed from, a professional casuistry which may not wisely be ignored The Ideal inheres in these, and may be inferred from them, but they do not clearly define it We may supplement their witness by changing our point of view, and regarding the profession not from within, but from without What is the expectation with respect to professional conduct which reigns in the public mind, which determines the measure of social consequence which the members of the profession possess, and which forms the standard by which individuals are judged? Men's behaviour is shaped by the expectations which they evoke in the minds of their fellows hardly less than by the conscious intentions which fill their own *Noblesse oblige* really means that public expectation has coercive power even over private conduct

THE HIPPOCRATIC OATH

The physician in modern society holds a very high place He is generally regarded with respect It is not merely that his distinctive service is indispensable, and is universally required, but also that he commands the public confidence in a very notable degree, and has behind him a tradition of professional behaviour which is generally admired It is assumed that he will be adequately trained, that he will be entirely honourable, that he will be patient, considerate, and assiduous, that he will be generous and even-minded, giving his service as frankly and fully to the poorest as to the richest of his patients, that he will be, in a quite astonishing measure, disinterested We expect the doctor to be something more than a scientific specialist, skilled in his specific branch of work We look for education and good manners He must be welcome in society for his own sake No doubt there is a measure of idealizing sentiment in this conception of the physician, but it is near enough to general experience to maintain itself in the teeth of all individual contradictions, and its existence is not only a remarkable evidence of the high level of medical professional habit in the modern world, but also a precious possession of the medical profession itself The Ideal has, of course, never been realized fully in any individual If it had been so realized it would have ceased to be the ideal Like all ideals, it is a composite of which the component elements have been separately expressed But the combination in a single picture sets before every medical student a goal which he must strive to reach That picture was upheld to the physicians of ancient Hellas in the so-called "Hippocratic Oath" It was natural to link it with the name of Hippocrates, for he "will ever remain the type of the perfect physician" Let me quote a few sentences which I take from Dr Charles Singer's charming article on "Medicine" in the volume entitled *The Legacy of Greece* The ancient Greek physician accepted the following version of his professional duty

"I will follow that system of regimen which, according to my ability and judgement, I consider for the benefit of my patients, and abstain from whatever is deleterious and mischievous I will give no deadly medicine to anyone if asked, nor suggest any such counsel, nor will I aid a woman to produce abortion With purity and holiness I will pass my life and practise my Art Into whatsoever houses I enter, I will go there for the benefit of the sick, and will abstain from every evil of mischief and corruption, and above all from seduction Whatever in my professional practice—or in connexion with it—I see or hear in the lives of men which ought not to be spoken of abroad, I will not divulge, deeming that on such matters we should be silent"

"Respected equally throughout the ages by Arab, Jew, and Christian," comments Dr Singer, "the oath remains the watchword of the profession of medicine" It is only, however, in modern times that society generally has acknowledged in the medical profession such a standard of professional behaviour as the Hippocratic Oath demands. The brilliant dawn of Greek medical science was soon over cast, and succeeded by the "cloudy and dark day" of superstition and barbarism It was not until comparatively recent times that the Greek tradition was recovered, and medicine became genuinely scientific in method

THE PRE-SCIENTIFIC ERA

The physicians of the past were the victims of their circumstances In the pre-scientific era, which may perhaps be defined as the entire period *before Harvey* (ob 1657), they were so badly handicapped by ignorance that their meagre successes in the curative art generated more suspicion than confidence They were known to be often the heralds of death, they were seen to be often powerless to preserve life Moreover, their services were sometimes sought for the purpose which they were so plainly able to serve The death of individuals might be desirable for a variety of reasons, and the doctor's professional skill might be invoked by jealousy, hatred, and ambition, as well as by duty and pity The popular imagination, which ever inclines to be morbid, magnified the facts, and on a very slight foundation raised a truly formidable fabric of suspicion It is difficult to imagine a more damaging professional recommendation than that which the Roman people bestowed on the physician of the unpopular Pope Adrian VI, when they hastened to his house, on hearing the welcome intelligence of the Pontiff's decease, and hanged a wreath on the doctor's door inscribed "*To the deliverer of his country*" It was an inevitable association of ideas which led them to connect Adrian's sudden demise with his physician's professional attentions The suspicions of ignorance are as cruel as they are often unwarranted Thus when Austregild, the queen of Guntram, knew that she was dying, she wreaked her indignation on the doctors who had failed to cure her Summoning her royal husband to her bedside, she made him swear to have them slain as soon as she expired I follow the chronicler

"So saying she gave up her unhappy soul But the King, the funeral rites duly performed, was constrained by the oath sworn to his unjust queen, and fulfilled her wicked behest For he ordered the two doctors who had served her well to be slain by the sword It stood plain in the judgement of thinking men that such fulfilment might not be without sin"

* Introductory address to the University of Durham College of Medicine Newcastle-upon Tyne October 1930

The profound pessimism which governed mediæval thinking invested the very notion of curing diseases and thus cheating death with a doubtful if not actually irreligious character Sorcery, magic, and witchcraft were closely connected with medicine, and these created a certain shrinking in orthodox minds Moreover, it is certain that many disreputable quacks pretended to curative skill, and the circumstance that the best medical knowledge of the time was to be found among Jews, Mohammedans, and heretics did not tend to reassure the public Then the sinister connexion between the patient's misery and the physician's fees was never forgotten Even so amiable and intelligent a writer as John Earle, writing in 1638, harps on this string In his *Microcosmography* he includes a description of what he calls "a meer dull physician" as both hard and covetous

> Anatomies and other spectacles of mortality have hardened him and he is no more struck with a funeral than a grave-maker
>
> In conclusion he is a sucking consumptive and a very brother to the worms, for they are both engendered out of man's corruption

Similarly of "a surgeon" we are told

> He deals with broken commodities as a broken head or a mangled face and his gains are very ill got for he lives by the *hurts of the commonwealth*

These are, of course, very ancient gibes Pliny tells us that in his day they were hurled at the medical profession The considerate casuistry by which doctors may rightly conceal from their patients the gloomy view which they may have formed of their patients' prospects, passed into the ill-sounding proverb, *Mentiris ut medicus*—"You lie like a doctor" And as late as the nineteenth century Byron repeats the hackneyed jeer with a characteristic touch of satire

> This is the way physicians mend or end us
> *Secundum artem* but although we sneer
> *In health—when ill* we *call them to attend us*,
> Without the least propensity to jeer
> While that *hiatus maxime deflendus*,
> To be fill'd up by spade or mattock's near
> Instead of gliding graciously down Lethe
> We tease mild Baillie or soft Abernethy

Doctors in the seventeenth century, and indeed for long after, were suspected of learning by experiment on their patients, a half-truth which easily passed into the grossest injury Jeremy Taylor, in his well known treatise *Ductor Dubitantium*, quotes Pliny as complaining that physicians grow learned at our risks, and make their experiments at the cost of our deaths, so that they alone can kill a man with impunity, and he adds the plaintive comment that it is hard that the physician should grow wiser at no cheaper rate than the deaths of many patients Fuller, writing about the middle of the seventeenth century, in his picture of the "Good Physician," lays down the maxim

> *He handseth not his new experiments on the bodies of his patients*—Letting loose mad receipts into the sick man's body to try how well nature in him will fight against them whilst himself stands by and sees the battle except it be in desperate cases when death must be expelled by death

Science and Humaneness

The remarkable confidence with which the medical profession is now universally regarded has its root in the fact that there is now truly a Science of Medicine, and that the patient is no longer the victim of arbitrary empiricism or an unintelligent following of tradition An essential element in our ideal of a doctor is scientific training, and (what is by no means the same thing) the scientific temper

Humaneness hardly less than Science is integral to our conception of the ideal physician, and this too, is a very recent acquisition Surgery was long handicapped by the horror inspired in the popular mind by the indispensable methods of surgical training Sentiment allied itself with the crudest religious beliefs to oppose the practice or dissecting dead bodies, which yet was essential to anatomical study The surgeons were as insistent as the public was reluctant Visitors to Scotland will have noticed the large iron cages, or railings placed over graves which give so sinister an aspect to Scottish graveyards They were devices to hinder the persistent efforts of the "resurrectionists," as they were grimly styled, who sought to supply, at large profit to themselves, the professors of anatomy with bodies for dissection by robbing the graves of freshly buried corpses It is barely more than a century since the whole country was thrilled by the revolting story of Burke and Hare, two miscreants who had pursued for years a business of lucrative crime by selling to the surgeons the bodies of those whom they murdered Such revelations of callousness and criminal greed created a great volume of repugnance in the public mind, and this could not but extend to the profession which was in some measure interested in such horrifying procedures We know how, even at the present time, an irrational opposition to the practice of what is loosely called "vivisection" can sweep educated and normally reasonable people into extraordinary violations of equity and good sense If, then, humaneness has come to be conspicuously associated with the popular conception of a physician it is because the conditions of scientific research are more generally understood, and the processes of medical training are apparently related to the requirements of science

The experimental method, which is the normal procedure of physical science, and the very condition of that marvellous development of medicine which is the conspicuous glory of the modern epoch, lent itself to the crudest misunderstanding in minds clouded by barbarous superstition and filled with ignorant suspicions They did not see in experiment that patient interrogation of Nature which is the law of scientific advance, but only the expression of an irreligious curiosity or the indulgence of a fiendish cruelty As the scientific atmosphere was created, and even the humblest ranks of society acquired a vague understanding of the scientific point of view, above all as the curative triumphs of medical science became generally known, this association of the physician with harshness and callousness to pain died in the popular mind, and was replaced by the more natural association with physical rescue and relief Science and humaneness blended in the popular conception of the physician, and became so inseparable that in the common view the doctor was the symbol of beneficence Few things are, in my judgement more honourable to the medical profession than the note of trust and something like affection which marks the language of the poor when they speak of the doctor

Some of you will have read an admirable novel *My Brother Jonathan*, by Francis Brett Young, in which a charming picture, which is also true to life, of a general practitioner working among an industrial population is drawn by a master's hand The doctor is shown in circumstances of exceptional difficulty winning by sheer generosity of service the trust and affection of the poorest people In this connexion we may mention the influence of the medical officers, who within recent years have come to hold so important a place in the hierarchy of local government They have thrown themselves with so much enthusiasm into the work of hygienic improvement that in many cases they have felt and spoken as the apostles of social reform We may not unfitly call them the Tribunes of the People The element of professional ambition was of course not absent Medical officers also "magnified their office" and personal interest is never entirely separable from professional ambition Nevertheless, it is certain that a higher motive entered, and that in many cases it carried men to great heights of unselfish and sometimes unpopular toil and filled them with a generous enthusiasm for public service I think our medical officers have made no mean contribution to the shaping of the Physician's Ideal

Let us pass from the professional to the more personal aspects of our subject I said that the modern physician is expected to be a cultivated and well mannered man acceptable in society, which assigns to him an assured and dignified position In antiquity it was generally otherwise Nor is this surprising when we remember that physicians were largely slaves and freedmen and generally quite uneducated I borrow from Friedländer the following account of the physicians of imperial Rome

> Medicine was up to the last largely in the hands of freedmen and slaves Justinian authorized the maximum price (sixty gold pieces) for a slave thus trained eunuchs fetching only five Jurists constantly speak of the services due from physicians'

trained freedmen thus they had to visit their patrons friends gratuitously Patrons could also prevent their freedmen from setting up a competing practice, and with this object, compel them to accompany them on their own visits

"Free born physicians at Rome were mostly foreigners If permanent residents, Julius Caesar enfranchised them, as also teachers Augustus extended this by conferring civic immunity Romans, according to Pliny, rarely learned this profession

"In antiquity there were no examinations and little responsibility hence many unqualified practitioners thrust themselves into a lucrative profession, such as shoemakers, carpenters, dyers or smiths, just as unsuccessful doctors became corpse bearers or professional gladiators, at any rate Martial scoffs at such, who in their new occupation practised the old one still Amongst these quacks, makers of salves and official wares rank high Galen says that most so-called physicians of his day could hardly read, and warns his colleagues of the necessity of good grammar in addressing patients such physicians also would know nothing whatsoever of rhetoric and philosophy Thessalus, an apprentice of his father, a weaver, as a doctor under Nero gained great vogue, and said all his knowledge had been won in six months

"Galen gives very definite counsel as to medical relations with the patient. His visits should be long or short as his patient wished, whom he must not irk Some doctors clumsily awake and irritate a patient by long speeches or noisy tread such things must be avoided

"Some patients must be enlivened with anecdotes The doctor must deport himself properly, not be pompous, affected, or cringing Many doctors acceded to their patients every wish, giving them cold water, snow-cooled wine, baths, whenever requested True, they thus found a ready key to many doors They grew rich had much power, and often had pages given them as pupils The rich were the *most rebellious patients* best avoided altogether, says Galen but doctors had willy nilly to put up with their whims Whilst disapproving of mere submissiveness, in special circumstances the physician might, against his better knowledge, indulge the patient in some comparatively harmless trifle doctors, if loathed, are not obeyed"

It is sufficiently apparent that we have travelled a long way from the professional standard of the Hippocratic Oath, but the Romans were a coarse-minded and practical people, which vulgarized and degraded the intellectual treasure which they received from the Greeks whom they conquered, and medicine was no exception to the general rule

The professional behaviour of the fashionable physician has been the mark of hostile criticism in modern literature, where "a good bedside manner" is often associated with insincerity and toadyism You will remember how Anthony Trollope has drawn the portrait of the honourable physician in the plain-spoken Dr Thorne, and set it in sharp contrast with that of his accommodating but insincere professional rival, Dr Fillgrave Bluntness of speech may, indeed, be prompted by something less respectable than honesty I borrow an instance from the fascinating pages of Professor Trevelyan's latest historical publication He is speaking of the drunkenness which disgraced English society in the reign of Queen Anne

"The leading physician in the capital, Dr Radcliffe, whose highly rewarded skill and generous disposition stand commemorated in one of the noblest buildings of his old University, was once sent for at an unseasonable moment to attend the Princess Anne He blurted out over the bottle that 'Her Highness's distemper was nothing but the vapours' This piece of truthfulness in wine, being reported at Court, had, his biographer tells us, the effect of permanently consigning the future queen and her family to other and less skilful hands—possibly with important consequences to the history of England"

Dr Radcliffe's tongue was at all times more clever than well guided In 1697 he was summoned to attend William III "When he saw the King's swollen ankles, he said that he would not have the King's two legs for his three kingdoms" This gave such offence that William never saw him again Of the famous Dr Abernethy (1764–1831) it is recorded that he had a serious purpose in his notorious rudeness and even brutality of speech Not only did he thus indicate his horror of "humbug," but he found, or thought that he found, that a masterly roughness commanded the confidence of his patients even better than an amiability, possibly suggestive of weakness, would have conciliated it Happily most modern physicians have discovered a middle way between the toady's insincerity and the boor's rudeness Certainly the Physician's Ideal includes culture and the courtesy which culture requires

Francis Bacon's counsel is marked by the shrewd wisdom which was characteristic of that famous man

"Physicians are some of them so pleasing and conformable to the humour of the patient as they press not the true cure of the disease and some other are so regular in proceeding according to art for the disease as they respect not sufficiently the condition of the patient Take one of a middle temper or, if it may not be found in one man, combine two of either sort, and forget not to call as well the best acquainted with your body as the best reputed of for his faculty"

Mind and Body

The ideal physician unites technical knowledge and a just understanding of the specific circumstances of his patient's case Within the last generation the range of the physician's professional concern has been greatly extended The sharp dividing line between the psychical and the physical has grown fainter, and tends to vanish and Psychotherapy has attained a settled place in the procedure of medical science, and it has emphasized those aspects of the physician's task which are least technical and academic The physical ills of men are seen in a larger context Behind the familiar symptoms of physical disease he forces and factors which are not physical, which can often but be guessed at, and which none the less condition the potency of the appropriate remedies There is a disastrous reciprocity between mind and body Disease may occasion such a depression of mind as may aggravate it, and even go far to make it incurable The causes of mental depression may be ultimately moral and religious—a bad conscience or a superstitious belief Shakespeare, in *Macbeth*, has pictured a doctor confessing his powerlessness in front of such morally conditioned physical distress Must the pathetic appeal remain for ever unanswered?—

> Canst thou not minister to a mind diseased,
> Pluck from the memory a rooted sorrow,
> Raze out the written troubles of the brain,
> And, with some sweet oblivious antidote,
> Cleanse the stuff'd bosom of that perilous stuff,
> Which weighs upon the heart?

In this situation, where the physician *qua* physician is helpless, the clergyman may find the opportunity of exercising his distinctive ministry, and the two great curative professions find themselves in an alliance which is exalting to both You will perhaps be familiar with that brilliant volume of the late Dr Rivers, *Medicine, Magic, and Religion* There that keen and honest thinker envisaged in the future a great reconciliation, which would reproduce with a difference the primitive harmony which specialization had broken up

"If medicine," he says, 'is to maintain its hold on certain aspects of disease which should come properly within its sphere, it must find that it has much to learn from the priest, if, indeed, some kind of collaboration between the two is not often desirable"

The Lambeth Conference set on record its conviction that "there is urgent need for co-operation between clergy and doctors, since spiritual and physical treatment are complementary, and equally necessary for true well being" I think the Physician's Ideal includes a freedom from traditional prejudice which welcomes such an honest acceptance of scientific truth as will not exclude any new departure which it may require in professional habit

The Labour and the Hire

But I must not ignore the protest which may well be taking shape in some of your minds It may be stated in this way "When all is said about the Physician's Ideal it remains the case that men become doctors primarily in order to earn their living They look to be paid for their services, and their professional success is measured by their professional income In the coarse phrase of the market place, Fine words butter no parsnips The doctor, like other wage-earners, has 'got to live'" It must be frankly acknowledged that this protest expresses truth but certainly not the whole truth And the truth which it omits is so important that its omission may transform even the truth which it states into perilous falsehood In all the higher human employments there is a certain incongruity between their true end and their immediate purpose "Those three noble Professions which all civi

Commonwealths do honour," says Sir Thomas Browne in his quaint fashion "are raised upon the fall of Adam and are not any way exempt from their infirmities" The lawyer is ordained to secure justice, but litigation is the source of his wealth The clergyman is ordained to promote goodness, but his benefice provides his income The physician is ordained to promote health, but it is sickness that fills his purse Lawyer clergymen, and physicians are all tempted so to pursue the lower immediate purposes of their professional work as to forget its supreme and ultimate end Just as they yield to this temptation, they lower the levels of their actual achievement, and become even professionally inefficient For it is always true, and never so true as in the case of the nobler employments of men, that the higher the mark aimed at the higher is the mark actually reached Aim lower, and you will hit lower You cannot place a money value on the services of the lawyer, the clergyman, and the physician, for their distinctive service demands over and above the professional duty, something personal which defies calculation I suppose that is the reason why their remuneration is generally determined by conventional payments or fees, and is not left wholly to 'the higgling of the market" The really great lawyer has a passion for justice, the really great clergyman has a passion for goodness the really great physician has a passion for health—although it is *true that, if all men were just good, and healthy*, there would be no demand for lawyers clergymen, and physicians. They are all to that extent conspirators against their own professional importance

You will have noticed that Sir Thomas Browne makes no mention of that great profession which holds so large a place in our modern world, and has its unchallenged supremacy in our universities—I mean the teaching profession The reason is not doubtful In that relatively simple age, teachers were generally also clergymen, and Sir Thomas Browne tacitly includes them under that description The twentieth century is not as the seventeenth It is familiar with a range of studies vastly greater, so that perforce the teaching profession has become independent, organized, and increasingly powerful But teachers do not stand outside the general law They also have to work with both a nearer and a more distant objective *Examinations* have to be passed, and the teacher has to aim at securing his pupils' success, but always he has a higher end He has to set forth the truth and so to teach as to make his pupils also lovers and servants of the truth If it shall so fall out that these ends are conflicting so that to advocate current errors, dominant in the schools, will condition success in examinations by treason to the truth, then loyalty to his Ideal will require that the teacher should accept unpopularity, and even professional failure Do undergraduates still read Browning? When I was at Oxford we were fond of his poem *A Grammarian's Funeral*, which illustrates wonderfully what I am now insisting upon Here is the contrast between loyalty and treason

> That low man seeks a little thing to do
> Sees it and does it
> This high man with a great thing to pursue
> Dies ere he knows it
> That low man goes on adding one to one
> His hundred's soon hit
> This high man aiming at a million
> Misses an unit
> That has the world here—should he need the next
> Let the world mind him'
> This throwing himself on God and unperplexed,
> Seeking shall find *him*

Let me quote again from the *Religio Medici* of Sir Thomas Browne which, though written as long ago as 1635, is eminently worth reading by the modern physician, and which I beg heartily to commend to you

> I feel not in me those sordid and unchristian desires of my profession I do not secretly implore and wish for Plagues rejoice at Famines revolve Ephemerids and Almanacks in expectation of malignant Aspects fatal Conjunctions and Eclipses I rejoice not at unwholesome Springs, nor unseasonable Winters My Prayer goes with the Husbandman's I desire everything in its proper season that neither men nor the times be put out of temper Let me be sick my self if sometimes the malady of my patient be not a disease unto me I desire rather to cure his infirmities than my own necessities Where I do him no good methinks it is scarce honest gain though I confess 'tis but the worthy alarm of our well intended endeavours I am not only ashamed but heartily sorry that, besides death there are diseases incurable yet not for my own sake or that they be beyond my art, but for the general cause and sake of humanity whose common cause I apprehend as my own

Loyalty to the Ideal

The Physician's Ideal has been slowly and painfully gained in the teeth of many hostile forces, and if it is to be maintained and transmitted, it will only be by strenuous and high minded effort To-day, if I mistake not it is threatened by some of the characteristic developments of our time Specialization in medical study and practice may be indispensable, but it endangers none the less that largeness of interest and culture which has marked the greater physicians of the past Contemporary politics cast their own shadows on the progress of medical science Socialism is not friendly to the highest individual achievement The democratic tendency to bring physicians into the category of State officials, and to organize their professional activities on conventional Civil Service lines, is not wholly favourable to the highest view of their work, and may lower that personal relation with their patients which has often been highly *beneficial to both* 'The years teach much which the days never knew," says a wise proverb, and we must not be hasty to condemn the untried It is always easy to be unfair to the distinctive features of one's own time, very easy in the case of a man whose own experiences of society belong to the past At least I am on safe ground when I insist—and this is the moral of my present address—that, whether as a State servant or as a private practitioner, the physician's efficiency will continue to be conditioned by his resolute loyalty to the Physician's Ideal

'SCIENCE DISCIPLINE"

LECTURE BY SIR DAVID PRAIN

Lieut.-Colonel Sir David Prain, LL.D M.B., F.R.S., I.M.S (ret.), delivered the second annual Alexander Pedler Lecture on October 22nd, in the University of Liverpool under the joint auspices of the British Science Guild and the University The subject of the lecture was 'Science discipline"

Huxley he said held that in an ideal university a man should be able to obtain instruction in all forms of knowledge, and discipline in the use of all methods by which knowledge might be obtained For him there were three forms of knowledge the limits of one's individual powers the rules to which these powers may be put and the conditions under which these powers can be used These forms of knowledge were the same for literature as for science for science and literature were but two sides of the same shield Science, however no longer connoted all knowledge but meant more particularly natural knowledge Science discipline therefore implied cultural exercise of every method by which natural knowledge could be obtained as contrasted with science training which implied technical exercise in any method by which natural knowledge might be employed

The Purpose of Discipline

The older object of science training was to make an adequate number of scholars already disciplined in the requisite natural knowledge competent to give the general community effective scientific help and confusion should be impossible between training and discipline in this sense The purpose of discipline was twofold on the one hand to furnish those who studied to serve the community scientifically with the kind of natural knowledge that would enable them to profit by training for technical efficiency and on the other hand to render all scholars in an ideal university competent to appreciate the scientific help afforded the community by those specially trained to give it This second object was nothing less important than the first And while the first of these ends had now

been largely attained, perhaps in due course the need for securing the second might come to be appreciated by those responsible for the organization of science discipline

Technical and Cultural Faculties

The fourteenth century faculties of Theology, Law, and Medicine were technical faculties where everything about God, or Man or Nature was taught to clerks who already knew something about everything But it was found difficult to man the medical faculty and the cultural faculty of arts was often deprived of a valuable "ingredient in education" by assigning to the technical faculty all suitably equipped teachers The Church approved, eager to secure control of ethics and philosophy In the next two centuries universities 'complete with all the faculties" came into existence under ecclesiastical patronage and a new spirit of criticism spread from the cultural to the technical faculties If disputation led to confusion there was compensation in the improvement in science discipline Controlled experiment was substituted for empirical test But, teachers who were prepared to abandon scholastic controversy could not resume instruction in a technical faculty for lack of the experimental discipline in themselves There was cleavage While Catholic Faith tolerated the "rule of man's estate," Reformed Faith could see in precaut[illegible] against plague proof of "distrust in Providence" M[illegible]ous, science formed an 'invisible college" outside the univ[illegible]ents where they could talk in safety The sciences became [illegible]bitists, and the arts the sciences In the eighteenth centu[illegible]many when the English 'common people" were "constant [illegible]reconcilable enemies of science," natural philosophers were thus led to leave application to the initiative of the arts and crafts, and the old distinction between an art and a science appeared in a new form contrasting what "they were melined to" with "what they had a mind to"

Association with a technical faculty enabled teachers of natural history to avoid this error for nearly a generation, and soon, as Huxley said, scholars who wished to obtain a training in physical science had to attend the instruction of the medical schools Universities came to regard the teachers of the medical faculties as responsible for science discipline as well as training Botany, by its return to the study of function, had made itself the first academic science to realize that "what people call applied science is nothing but the application of pure science to particular problems" It needed the lesson of the great war to convince our legislators of the truth of this remark, and an Association for the Advancement of Science had to reach its hundredth year before it found a president courageous enough to say that between pure and applied science there was no real distinction

The Two Kinds of Science Discipline

There was room for hope that academic opinion might now cease to consider second rate advancement more important than first rate application of natural knowledge General cultural science discipline was the proper business of faculties of arts, not of science A special scientific discipline, preparatory to technical training, also had its place within the universities and demanded recognition and special organization Sound practical instruction in the elementary facts and broad principles of biology should form part of the arts curriculum The discipline in physiology that a prospective scholar of medicine must undergo might in itself provide a better education than much that was accepted under that name With anatomy, it had its place in the science faculty Huxley had been aware that with the necessity for direct practical perception of facts there arose the need for an amount of personal labour and a development of means and appliances and he knew that these needs created difficulties that would not be removed until years of patient study had organized scientific teaching as well as or better than, classical teaching The absence of any serious attempt on the part of those entrusted with university organization to devote themselves to the "patient study of scientific teaching" in their faculties of arts was directly responsible for much of the justifiable disquietude felt by both teachers and students of natural knowledge to day

The failure to follow Huxley's advice, Sir David Prain said in conclusion, had been due not to disbelief in his judgement, but to the national propensity, which made neighbouring nations dislike us, for doing one thing when we imagined we were doing something else It was of less consequence for teachers of science to fail to distinguish between the functions of a technical and a cultural faculty than to fail to make their universities understand the difference in method between the science discipline for culture and the science discipline that prepared for training Teachers of literature, with a like problem before them, experienced no such difficulty in persuading their universities to do what they required

SOCIETY OF MEDICAL OFFICERS OF HEALTH

Annual Meeting and Presidential Address

At the annual general meeting of the Society of Medical Officers of Health Professor Harold Kerr of Newcastle-upon-Tyne was installed president in succession to Dr J J Buchan Occasion was taken, on the retirement of Mr George Elliston, for many years executive secretary of the society, to express the indebtedness which members felt to him for his services Dr G F Buchan, the treasurer, said that no man could have worked more carefully or skilfully in the financial interests of the society Mr Elliston became secretary when the financial position was very uncertain, but his careful administration of the society's affairs had achieved the best possible financial results, and the society found itself to-day in a sound and comfortable position No society ever had a better secretary, and no treasurer a more active or capable or courteous colleague Dr Charles Porter, honorary editor of *Public Health*, paid an equally warm tribute to Mr. Elliston's services

The Municipal Hospital.

The brief presidential address by Professor Kerr took the form of a statement of the position in Newcastle-upon-Tyne, in view of the changes brought about by the Local Government Act, 1929 The past year, said Professor Kerr, had been a most important epoch in the history of public health administration, and it was very fitting that at a time of such change the chair of the society should have been occupied by Dr J J Buchan, whose authority (Bradford), ten years ago, gave a lead to the country by transforming the Poor Law hospital into a municipal institution The pioneer work done in Bradford, and also in Aberdeen and (under Dr Buchan's brother, Dr G F Buchan, another past-president) in Willesden, should never be forgotten Only those intimately concerned could appreciate the difficulties which were encountered in bringing about this now well recognized piece of social reform It was upon the medical officers of health that the first responsibility rested of guiding their respective authorities wisely so far as health administration was concerned Hitherto, for the most part, the Poor Law hospitals, however acute the hospital shortage in the locality might be, had served only the destitute cases In London there had been a measure of co-operation between the two classes of hospitals, and the same was true to a certain extent in a few of the larger towns, but in most areas there had been no co operation at all The guardians in the majority of places had done their utmost to popularize their services, but the Poor Law stigma remained a permanent objection Newcastle was one of the areas where the guardians did everything in their power to attract private patients, but with comparatively little success Their wards and equipment were excellent and up to date, there was also available a part time consulting staff But invariably there were plenty of empty beds in the Poor Law hospital, although the Royal Victoria Infirmary in the same city had an average of 2,000 on its waiting list

Professor Kerr went on to describe in detail the equipping and staffing of the renamed Newcastle General Hospital, and the allocation of beds For the present at least no out patient department would be established other than for cases which had been discharged from the wards, and which it was desirable should be followed up Nor would there be any special departments created giving similar facilities to those existing either at the Royal Victoria Infirmary or at a special hospital The guardians had favoured whole time appointments, although they were not prepared to pay attractive salaries The policy of

part time appointments had been decided on in the case of the municipal hospital. He mentioned the various salaries for these posts and said that there had been no lack of applicants. In the case of the two directors, one on the medical and the other on the surgical side, Newcastle had been exceptionally fortunate in securing the services of a senior physician and surgeon both of whom had recently retired under the age limit from the staff of the Royal Victoria Infirmary and who had been closely associated with the medical school. For teaching purposes the wards of the municipal hospital would be affiliated with those of the Royal Victoria Infirmary. The medical superintendent, a whole time officer, would remain, but he would act only as an administrative officer being relieved of clinical work except in regard to mental cases in which field he happened to be an expert. A shortage of nursing staff had also been made good.

Another rearrangement did away with one great objection to the old Poor Law hospital from the point of view of prospective patients—namely, the interposition of the relieving officer in all cases. With certain excepted cases admission would now be arranged for by direct communication between the private doctor and the medical superintendent. Ultimately it was proposed to set up a kind of bureau or clearing house which should allocate patients to an appropriate institution and avoid overlapping. It was anticipated that a gradually increasing admission rate would follow upon this reorganization, and that the municipal hospital would be availed of by people belonging to the lower middle class and working class who could not afford nursing home fees, and had an objection to accepting charity. At first the accommodation would be the same for all, ultimately it might be possible to provide private wards for people who could afford to pay for them, but as the Royal Victoria Infirmary had already provided private wards it seemed undesirable that the municipal hospital should do so. What would be the effect of all this upon the finances of the voluntary hospitals? Many opinions had been expressed, but there was only too good reason to expect a diminution of the smaller voluntary contributions. The larger voluntary contributions, he thought were not so likely to disappear, and the attraction of having a bed or ward named after the donor would still appeal to many. As it was extremely undesirable that the voluntary hospitals should be weakened contributory schemes, like that organized on Merseyside should by all means be supported. Such schemes should solve the question of the financial position of the voluntary hospital. One matter to which his authority had given a good deal of attention was the establishment of a central record office, where all assistance given from public or from voluntary sources should be noted so that abuse and overlapping were checked. One urgent need was general hospital treatment of mental breakdown not amounting to insanity or certifiable. It was estimated by the medical superintendent of Newcastle General Hospital, who as already stated was an expert in mental disorders that no fewer than 150 beds would be necessary for these pre-mental cases.

The Problem in London

Dr WILLIAM BRANDER, principal medical officer of the General Hospitals Division of the London County Council explained that owing to the magnitude and enormous complexity of the London hospital service, the problem in London was extremely difficult and the organization which might prove the most suitable for London was by no means necessarily the best for any other town in England and Wales. As a result of the Local Government Act, the General Hospitals Division of the London County Council now had under its administration twenty-nine separate hospitals containing upwards of 16,000 beds and fourteen other institutions containing roughly 11,500 beds together with thirty-four special hospitals and institutions with nearly 15,000 beds transferred from the Metropolitan Asylums Board. The number of mental hospitals now under the control of the London County Council including those transferred from the Metropolitan Asylums Board was twenty with accommodation for upwards of 31,000 cases. The transferred Poor Law infirmaries were speaking generally well built, well equipped and well staffed; some of them could fairly be described as first-class hospitals while others were below standard. With regard to the out patient departments at present such departments were already provided at nine of the Council's general hospitals, and undoubtedly resulted in an economy in beds. It was desired to avoid duplicating the out patient system of the voluntary hospitals, and therefore it was proposed to limit out patient departments to the following: casualties continuation and after treatment of discharged surgical patients; consultations on patients referred by the district medical officers, and ante natal clinical work. With regard to the appropriation of hospital accommodation, there was very little surplus accommodation in London, and what existed would be required to meet the statutory obligation with regard to the destitute sick. On the question of the lines on which whole-time or part-time staffs should be maintained, he thought that matters were not yet ripe enough for dogmatism. Like Professor Kerr, he paid a tribute to the work of boards of guardians handicapped as they had been by limited powers.

Dr J. J. BUCHAN confessed himself unable to see how the voluntary hospitals of the country could go on in the future as they had done in the past holding themselves out as charitable institutions, and providing the same accommodation for the poor as the local authorities were going to provide.

CONFERENCE ON MATERNAL MORTALITY

THE MINISTER OF HEALTH ON NATIONAL MATERNITY SCHEMES

THE fifth Conference on Maternal Mortality, organized by the Maternal Mortality Committee, a voluntary organization, and consisting of delegates from about 300 bodies voluntary and municipal, from all parts of England, was held at the Friends House, Euston Road, on October 27th.

The DUCHESS OF ATHOLL, M.P., who presided, congratulated those concerned on the organization of the successive conferences (the moving spirits of which had been Mr. H. J. Tennant and Miss Gertrude Tuckwell member of the Royal Commission on National Health Insurance) in that the actual facts of the excessive mortality among mothers, for which the conference had pressed from the beginning had now been brought out in the interim report of the Departmental Committee. She went on to point out that an admirable foundation had already been laid for a complete national service. Over 80 per cent of the population in the rural areas were now within reach of a trained midwife, and more than 70 per cent of that provision had been made by district nursing associations. There were only five counties (and these included such small ones as Rutland and the Isle of Ely) which were without a nursing association or federation of associations covering the whole area. In the towns there were now 440 municipal ante-natal clinics and 166 such clinics conducted by voluntary societies, exclusive of some 400 infant welfare centres where a measure of ante-natal advice could be obtained.

Mr ARTHUR GREENWOOD, Minister of Health, began with a reference to the stubbornness of the problem. Maternal mortality remained one of the black marks against the health service of this country. Infant mortality and the general death rate had been lowered and some diseases stamped out, yet deaths from the normal process of maternity were as numerous as ever. It was clear, from the information recently received that some 50 per cent. of maternal deaths were avoidable. The maternity and child welfare service and the national health insurance system had done something to relieve the situation, but had produced as yet no effective remedy. If the best that obtained in certain localities were put in operation in all localities a different tale might be told. Unfortunately, all local authorities were not equally good. If every local authority employed to the full extent the powers it now possessed there would be a marked impression on the maternal death rate. Sometimes," said Mr. Greenwood, "I wish I were a Mussolini but fortunately or unfortunately we do our permanent work in this country on the basis of maximum agreement. I am going shortly to appeal to all local authorities to try to live up to the standard of the best." Behind the powers which might be exercised by local authorities lay another problem. He knew of areas where ante-natal provision was made

and only a minority of pregnant women took advantage of it It was of no use badgering local authorities if in the end women did not use these facilities But that was not all He always believed in war on the widest possible front Committee after committee had stated that it was essential to establish a national maternity service Schemes had been brought forward for mobilizing on a national scale all the forces concerned directly and indirectly with this problem The education of the doctor and of the midwife had an important bearing on the question It was clear that a number of deaths were due to the fact that those who handled the cases were lacking in knowledge and, it might be here and there, were lacking in care He hoped it would be possible to do something in the very near future to ensure better education for those who were concerned strictly in the maternity service, and to keep them abreast of the results of most recent research It was most important to give practitioners facilities for "refreshing themselves in that new tide of knowledge which has come forth since they bathed in the stream," and with the improvement in medical education which he thought it would be possible to bring about with the good will of all concerned, must go post-graduate study He had read with the greatest interest every proposal made of recent years for a national maternity service, though he was not sure that he had yet met a person who quite understood what it meant It was the easiest thing to invent phrases, but behind that phrase, which represented an ideal and an objective, lay a good many difficulties He was satisfied that the best was not to be obtained from the available resources unless the good will of the people most concerned in the problem was secured Therefore he had not got a national maternity scheme cut and dried to place before the conference that day But the Government was committed to a national maternity scheme which should fulfil all the principles laid down in the successive reports and embody the principles of the resolution presently to be moved The scheme could only be framed in detail when those of them who would have to work it in the long run sat down and tried to come to a general understanding "If we are to utilize all that is good in the various agencies now operating—the medical profession, the approved societies, and the local authorities—it is not going to be an easy task I should like to bring the administration of the national health insurance scheme and the local health authorities under one great national umbrella, so as to arrive at a really effective maternity scheme on a national basis That I believe to be the only effective way of dealing with this problem But I should not be fair to the voluntary agencies on the one hand, and the medical profession and approved societies on the other, if I pretended I could do it without their whole-hearted co-operation" He would do everything in his power to bring into being a national maternity scheme which would stamp out the disgrace of unnecessary maternal deaths, believing as he did that, by a proper mobilization of all the forces, many of the so-called "inevitable" accidents of maternity could be avoided It was difficult during a stage of negotiation to talk freely, he did not want to suggest that any of the agencies concerned in this problem were likely to be obstructive, but he did not think he would be doing the cause a service if he were to be too specific before he had taken common counsel as to the proposals which had come forward in the various reports He wanted a general laying together of heads for the production of the best practical scheme for a national maternity service

Terms of Resolution

Viscountess Erleigh moved, and Dr Marion Phillips, M.P., seconded, the following resolution

> This conference declares its agreement with the recommendations of the report which supports its previous demands for an effective national maternity service based on (1) an increase in the length and content of the training of medical students in obstetrics, and on (2) essential services to be provided as follows
>
> (*a*) The provision in every case of the services of a qualified midwife to act either as midwife or as maternity nurse
>
> (*b*) The provision of a doctor to carry out ante-natal and post-natal examination in every case, and to attend during pregnancy, labour, and the puerperium, as may prove necessary, all cases showing any abnormality
>
> (*c*) The provision of a consultant, when desired by the doctor in attendance, during pregnancy, labour, and the puerperium
>
> (*d*) The provision of hospital beds for such cases as need institutional care
>
> (*e*) The provision of certain ancillary services—for example, transport, sterilized equipment, laboratory facilities
>
> The conference recognizes that some of the services now in operation have been due to voluntary effort It urges the co-ordination of such voluntary effort with the work of public authorities in order to enlist the widest possible interest and support in solving this problem, and expresses its conviction that the departmental committee is right in its conclusion that full success in reducing maternal death and morbidity can only be obtained by the co-ordination and extension of the various services in a national maternity service

British Medical Association Support

Dr H B Brackenbury, Chairman of Council of the British Medical Association, said that the resolution had the emphatic support of the organized medical profession It would be strange if it were not so, and he might be forgiven for calling attention to the fact that, just as was the case with the school medical service, so with regard to this matter, it was the medical profession which first urged on the attention of the public the necessity for it, and the British Medical Association which first formulated a concrete scheme It was a welcome and somewhat astonishing thing that the schemes which had been proposed by responsible bodies like the British Medical Association, the Medical Women's Federation, and the two Departmental Committees were in substantial agreement as to all the principles required for the establishment of such a service Only administrative questions remained to be dealt with, but this was a region of greater difficulty, because of the various interests which had to be considered From the fact that there was a great measure of unanimity in demanding that certain action be taken, it did not follow that the politicians and administrators would immediately, or at an early date, take that action There was need for a continuance of the education and propaganda which had been undertaken by the conference, so that whatever Government might be in power the necessity for giving prompt and careful attention to this question would not be overlooked The conference contained representatives of the three chief political parties, and all parties had been made to realize the importance of this question and had expressed their willingness at the proper moment to deal with it It was necessary to keep it to the forefront, so that, whatever the vicissitudes of political life, it might have a prominent place in the programme for the immediate future Dr Brackenbury pointed out also that although the Ministry of Health and others might at present be quite wise in urging that all the existing powers which the Legislature had given to local authorities should be put into effect and although it might be true that the time was not immediately favourable to a very large expenditure of public money on the establishment of a new social service, yet anything which was done as a temporary or tentative measure must have the complete national maternity service idea in view, and must not be such as to place any obstacles in the way, or materially to delay, the development of such a service There was sometimes a danger of provisional methods of tackling problems leading to postponement of the one complete thing without which success was unattainable

General Discussion

Dr Rhoda Adamson of Leeds, speaking as a teacher of midwifery, said that in her hospital 1,500 deliveries were dealt with annually, and last year there were 27 maternal deaths, 21 of these, however, occurred among the 246 cases which came in late on in labour There were six deaths in the "booked" cases which had had ante-natal care Of these six, one was a true accident of midwifery, another was the case of a woman who was a bed-ridden paralytic suffering from severe disease, and ought never to have been a mother This left four maternal deaths unexplained

out of more than 1,200 deliveries She complained that ante-natal care was not sufficient The women were not seen until they were actually expectant mothers She felt that women should be examined beforehand to ascertain whether they were fit to become mothers and that a great deal was to be said for requiring every girl to undergo a medical examination before marriage there were some women who should not be subjected to the risk of maternity She described the system at Leeds whereby ante-natal care was arranged for the expectant mother There was a "black list" of patients who were not allowed to be booked by a midwife because something had gone wrong in a previous labour these must book a doctor or go to the maternity hospital If any abnormality was found on which a second opinion was desired, the patient was sent to the ante-natal department of the local maternity hospital, where proper examination was made Any general practitioner in Leeds in charge of a maternity case could call in a consultant from a panel—the panel consisting of members of the honorary surgical obstetric staff of the maternity hospital—during pregnancy, labour, or the lying-in period The account for the consultant's services went to the maternity and child welfare committee, which took the economic circumstances of the patient into account and decided whether the fee should be recovered in whole or in part from her There was never any argument about the payment of the consultant

Lady Selborne urged that medical men should not think of midwifery as a minor part of their training She desired to see a special degree of "Doctor of Midwifery," without which no doctor should be allowed to undertake a confinement Mrs L'Estrange Malone regretted the absence of any reference in the resolution to the need for home helps for the mother, and also to the provision of milk for expectant and nursing mothers It was within the power of local authorities to make this provision, but the power was not much used She also pleaded that the permission given by the Minister should be taken advantage of by local authorities and information on birth control be given at infant welfare centres to married women who needed it on medical grounds Another speaker reminded the conference that sepsis following induced abortion was a very frequent cause of maternal death she had taken a secret ballot of some women attending a health lecture, and out of twenty-one of those who had been pregnant, sixteen confessed that they had themselves terminated a pregnancy without medical advice The remedy said this lady was birth control On the other hand another speaker a member of the Buckinghamshire County Council ascribed a great deal of maternal mortality to the unskilled and unaseptic use of contraceptive methods One other lady made an attack on the medical profession doctors she said sided each other through thick and thin, she urged that there ought to be a coroner's inquest on every woman who died in childbirth

With the addition of "home helps" to the ancillary services which should be provided in a maternity service, the resolution was carried unanimously

Scotland.

Radiology Department of Glasgow Western Infirmary

The new radiological department of Glasgow Western Infirmary was formally opened on October 24th by Mrs R D MacGregor, in the presence of a large and representative company Colonel J A Roxburgh, chairman of the board of governors, presided, and an address on the advancement of medicine, with special reference to radiology, was delivered by Dr C O Hawthorne, chairman of the Representative Body of the British Medical Association The new department, which is situated in Dumbarton Road, is equipped both for diagnostic work and for x-ray and radium therapy In his address Dr Hawthorne said that clinical study was being aided and reinforced to an increasing extent by laboratory studies, and the relations between these two methods was a matter of theoretical interest and of practical policy Most of the knowledge of medicine and surgery they possessed had been created by bedside observations and experience, and by the suggestions and conclusions to which these observations had given rise The notion that a patient's ills and requirements could be determined by some form of scientific test made in a laboratory by an observer who had never seen the sick man was only less fantastic than the claim that, given a film of blood on a piece of blotting-paper and some form of magical or electric box, there would be promptly revealed all the pathological disturbances of which the patient was a victim, and even his opinions The fundamental proposition as he saw it, was that no diagnostic conclusion could be safely reached, and no treatment wisely undertaken unless a complete knowledge of the individual had been acquired at the bedside, where he was regarded both as a patient and as a man Scientific discoveries and tests might contribute useful information relating to the prevention recognition, and treatment of disease but they could not take the place of bedside medicine With regard to x-ray examination the delicate, complicated, and costly machines that were now available gave greatly improved and more clearly defined pictures they shortened the period of exposure, and they gave complete protection to the operator so that never again would the pathetic story be heard of doctors losing their lives or limbs as the result of working with an x-ray apparatus Just as the discovery of x-rays in a physical laboratory had given them a radiological institute with all its possibilities, so discoveries in electricity, chemistry, and biochemistry had made their contributions to the knowledge of disease and the treatment of patients Conspicuous at the present day was the institute for the study of radium, and knowledge was gradually being gained both of its uses and its dangers The uses of radium were not yet by any means fully defined, and were apt to be rather exaggerated in the newspapers It was an element that was safe only in the hands of a specially trained and highly competent expert The work done in all these departments was linked with the efficient treatment of patients Such institutes required space equipment and maintenance, and therefore made a heavy charge upon the Infirmary fund Against this cost, however, had to be placed the efficient treatment of patients the development in the community of a body of highly trained physicians and surgeons opportunities for research and new discoveries the adequate training of medical students and the training of nurses It was in the results and services that justification could be found for the liberal policy of which the new radiological institute and its companion organizations were an expression

Combe Trust Health Lectures.

The first of a series of health lectures arranged by the Combe Trust was delivered in Edinburgh on October 22nd by Dr Chalmers Watson who took as his subject "The newer outlook on medicine" Dr J Parlane Kinloch chief medical officer of the Department of Health for Scotland who presided said they were passing through a very significant period for a great new health charter had just been formulated in the Local Government Act of 1929 In Edinburgh all the wide-spread services dealing with health with the single exception of national health insurance had been brought under the town council this afforded a unique opportunity He thought it was only a matter of time before national health insurance would also come directly within the province of town council They had the finest possible medical personnel but about a fifth of the patients of the family doctor could not be properly diagnosed or treated without the support of a sufficient institutional service It would be the duty of the health administration to make this provision for every practitioner although a great field had yet to be explored Such a service however implied that the individual was sufficiently educated to take advantage of it

Dr Chalmers Watson said that the practice of medicine might be fairly correctly regarded as medical engineering

On this analogy a modern motor show provided a revelation of what could be done in the short period of thirty or forty years by a judicious combination of sustained thought and high technical skill If even a fraction of the thinking power that had been expended on the development of the motor car were directed by the community towards securing the efficiency of the human machine, there could be no doubt that in a few decades the physique and health of the nation would be transformed The newer outlook on medicine implied consideration of two points—namely, how much of disease was preventable, and what steps were to be taken to prevent it Great improvements had been recorded in the past thirty years in tuberculosis, child welfare, schemes for venereal disease, and so forth, but the present hospital services were admittedly defective in meeting the growing requirements of the community Progress in preventive medicine, in his opinion, lay in two important directions one might be summed up in housing, and the second in nutrition He considered that nutrition was the basis of health, and that the propagation of knowledge of this subject among all sections of the community was essential

Edinburgh Royal Infirmary Appeal

The managers of the Royal Infirmary of Edinburgh have now issued an appeal for £500,000 in support of the bicentenary extension, referred to in the *British Medical Journal* of May 24th (p 971) The appeal points out that the Infirmary was founded, and has been maintained for two centuries, by voluntary effort, and that during this time it has brought fame to the city of Edinburgh through its school of medicine In the middle of the eighteenth century the system of teaching pursued at this medical school was an inspiration and example to pioneer schools of the New World, which were founded on the methods practised in Edinburgh It was in the wards of the old Royal Infirmary that James Young Simpson in 1847 successfully introduced the use of chloroform anæsthesia, and where Joseph Lister in the succeeding decade laid the foundations of a new era in the art of surgery During the two hundred years that have elapsed since 1729—when the Infirmary was founded with six beds—continuous development and extension have taken place The present institution in Lauriston Place has 1,000 beds, and nearly 20,000 patients are treated annually in its wards This hospital centre ministers to a large area of Scotland, as well as more distant places It is also an integral part of the Edinburgh School of Medicine in providing facilities for the education of medical students and the training of nurses The immediate requirements of the Infirmary are threefold The first is to provide extra accommodation for a waiting list, which has on an average between 2,000 and 3,000 names In the second place, a combined obstetrical and gynæcological department of 240 beds, with antenatal and out-patient departments, is to be erected as the result of co-operation with the Royal Maternity and Simpson Memorial Hospital In the third place, a new home for nurses, capable of making provision for 400 nurses, forms a definite part of the scheme The acquisition of the grounds and buildings of George Watson's College situated immediately to the west of the institution, in the autumn of 1931, will provide the site for the contemplated extension The site is estimated to cost approximately £100,000, the remaining £400,000 being required for the building and equipment of the maternity and gynæcological hospital, the nurses' home, and for other arrangements

Scottish Asylums' Pathological Scheme

In the thirty-third annual report of the Scottish Asylums' Pathological Scheme the Board points out that, in addition to the routine work done by the laboratory for contributing hospitals, a considerable amount of research has been carried out during the year by Dr F E Reynolds and his staff The most important contribution embodies the results of investigations into the pathways of infection to the brain from neighbouring foci of infection, for which Dr Reynolds was awarded a gold medal on graduating at the University of Edinburgh Other publications included pathological studies of cerebral tumours, published in *Brain*, and of the later manifestations of encephalitis lethargica, which appeared in the *Journal of Neurology and Psychopathology* The Board notes with appreciation the considerable extension of Dr Reynolds's teaching work in the University of Edinburgh, and especially his co-operation with Professor Edwin Bramwell on the clinical side, and with Professor W T Ritchie in systematic medicine Acknowledgements are made of grants from the Medical Research Council, the Carnegie Trust, and the Moray Fund (University of Edinburgh)

Bequest to Glasgow Royal Infirmary

Intimation has been received by the managers of the Glasgow Royal Infirmary of a bequest by the late Miss Margaret Clarke of Glasgow, who left the residue of her estate, estimated to be about £20,000, to be applied to the convalescent home of the Infirmary to be erected at Cammesburn This sum is in addition to a gift of £10,000 made to the Infirmary for this purpose in 1925 The donations are intended to commemorate her father, Dr Samuel Clarke, a well-known physician in Glasgow about seventy years ago, who took much interest in the Royal Infirmary, and of his father, Dr Andrew Clarke, who practised as a physician in Glasgow in the eighteenth century The Infirmary possesses a site for this auxiliary hospital, for which £43,000 has already been subscribed Further support, however, is required in order that the scheme may proceed, and so greatly relieve the pressure at the Royal Infirmary

England and Wales.

"Rheumatismus Specificus"

A Chadwick Public Lecture on the significance of rheumatism in youth and middle age was given by Dr Frances Bach in the Hastings Hall of the British Medical Association's House on October 23rd, with Sir William J Collins in the chair Dr Bach emphasized the importance of rheumatism as a national and international problem "It cripples the leg of the labourer on the soil and the arm of the toiler on the bench, and starts a life of cardiac invalidism for his child" Of every 1,000 persons insured, 28 were suffering from some form of chronic rheumatism, and of every 100 school children, 10 were suffering from some form of juvenile rheumatism He described his work in London, and the impression he had gained from recent studies in North America, Germany, and Scandinavia He regarded "rheumatic fever" as a manifestation of specific infectious disease for which he used the term "rheumatismus specificus" to differentiate it from other forms of so-called rheumatism It damaged in particular the heart, blood vessels, joints, and nervous system Eight out of every ten cases of organic heart disease recognized in persons under 40 years of age were due to this infection It was the cause of nearly every case of heart disease in childhood, and in the first years of industrial life or complicating pregnancy and childbirth, and two out of three cases of heart failure in middle life were due to it In England and Wales 20,000 persons died each year from the effects of "rheumatismus specificus"—in other words, from rheumatic fever and the manifestations of rheumatic heart disease It was therefore an important public health problem The disease was equally common in America and Germany, but the picture differed Whereas in this country the joint manifestations were common, in North America and Scandinavia environmental conditions tended to modify them, but the essential features—infection of the heart and blood vessels—were found in children and young men and women in those countries as commonly as in England Dr Bach then described the organized effort in North America to fight this disease He emphasized the value of a common classification, such as that in use in the majority of American clinics, and of organized statistical work The importance of rheumatic heart disease as a cause of maternal mortality justified the place of the heart specialist in the ante-natal clinic After referring to the value of vocational guidance and workshops for cardiac cripples, the lecturer ended with a plea for further research in the

laboratory and insisted that the essential lines of progress to-day were those preached a hundred years ago by Chadwick—namely, elimination of poverty and overcrowding and improvement of the dwellings of the poor

Guy's Hospital Annual Report

During the past six years the tale of those treated as in patients at Guy's Hospital has shown a steady increase. In 1924 the number reached 10,017, while the annual report for 1929 gives a total of 11,800. The inevitable increase in expenditure has not unfortunately, been balanced by the income although the deficit for 1929 was little more than half that of the preceding year. The governors are not inclined to take too gloomy a view of hospital finance, feeling that it is creditable that a charity only about a third of whose expenses are met by endowments should be able to meet 95 per cent. of its liabilities through a period of high taxation and falling trade. They feel little doubt that an increase in national prosperity will mean an equal rise in the fortunes of the voluntary hospitals. Although the number of available beds remains unchanged at 646, admissions increased during the year by about 250 more than the number for 1928 and the average stay of each patient decreased from 18½ to 18 days. The mortality rate maintains the level of the previous year—namely, 5·2 per cent. Some remarkable statistics showing the falling off in the consumption of stimulants, notable of beer, are included in the report. Even the quantity of brandy used has fallen from 250 gallons in 1859 to 71 during the past year, while the number of patients under treatment has increased from 4,658 to 11,245 in the same interval. Nearly 400 patients were sent to convalescent homes during 1929, and although there was a slight decline in the individual numbers of out-patients the total number of attendances exceeded those of the previous year. There has been a steady decline in the applications for maternity cards, which have fallen from 3,818 in 1908 to 1,639 in 1929. In the dental department a record has been established in the number of dentures authorized, 1,417 having been supplied during the year at a cost to each patient of £2 10s. There has also been an increase in the attendances at the Massage Department and thirty-nine pupils completed their training as masseuses during the year. In the Nurses' School the period of preliminary training has been increased from seven to fifteen weeks in order that a probationer may cover the entire syllabus for the Preliminary State Examination with the exception of lectures on the theory and practice of nursing before she enters the wards. This should have the desirable result of diminishing the strain under which a nurse lives during her first few weeks of ward work, while still in the preliminary training school pupils will be drafted into the wards for two hours daily during which time a corresponding number of the senior nurses will be released from duty and at liberty to study for examinations.

Tuberculosis in Hertford.

Dr. A. P. Ford, deputy medical officer of health and tuberculosis officer for the county of Hertford contributes to the report on tuberculosis in the county of Hertford for the year 1929 an interesting account of the value of certain forms of special treatment for tuberculosis which have been employed by him both in the sanatorium and at the dispensary during the year. Although for most early cases rest in suitable surroundings combined later with graduated exercise, suffices to restore the patient to working capacity, in some instances a course of tuberculin injections is given either in the sanatorium or after the patient's discharge with the object of making the repair more durable. When the disease is advanced the induction of artificial pneumothorax is recommended provided that the better lung is not too much damaged. In advanced febrile cases a course of sanocrysin is given in the hope of rendering hospital patients suitable for treatment at the sanatorium. At the beginning of the year there were fifty-six patients undergoing tuberculin treatment at the dispensaries in the eastern side of the county and during the year fifty-four other patients started the course. Of these 110 patients, 28 were still under treatment at the end of the year, 37 of the 1928 cases and 18 of the 1929 cases had completed the course, and in the remaining patients the injections were stopped either because the patient was not responding satisfactorily or because for some reason or other the patient was unable to attend for treatment. According to Dr. Ford the results on the whole have been decidedly satisfactory. He records similarly good results from the induction of artificial pneumothorax: seven patients have now had a full course of treatment—namely, three years or more of collapse followed by expansion of the lung. In two of these only partial collapse was secured but they are both well and able to work. Of the remaining five, four are apparently cured while the other is well and at work. During the year eight out of twenty-two patients in whom it was attempted to induce artificial pneumothorax were found to be unsuitable on account of adhesions. In seven patients the treatment has been discontinued: in four of these the course had been completed, in the remaining three the space became obliterated. One patient who had shown marked improvement while receiving the treatment for two years died owing to spread of the disease to the other lung. Dr. Ford's experience with sanocrysin has, on the whole, been encouraging. In seventeen out of twenty-six advanced febrile cases in which the treatment was tried the injections were discontinued before the course could be completed, either because no improvement was being obtained or because some complication had arisen. Of the nine who completed the course seven were benefited, three to a marked extent. Dr. Ford concludes that treatment by sanocrysin should be tried in all febrile cases that do not respond to ordinary treatment.

Courses at the Maudsley Hospital

A course of lectures and demonstrations, in two parts, for the diploma in psychological medicine will be held at the Maudsley Hospital, Denmark Hill, during the first five months of next year. The first part, which covers the first two months and begins on January 6th, comprises the following instruction: twelve lectures on the physiology of the nervous system, by Dr. F. Golla, at 2.30 p.m., on Tuesdays, January 6th and 13th, and at 4 on the remaining Tuesdays in January and February; also at 2.30 on the Fridays in these two months. Four lectures on biochemistry in relation to the nervous system by Dr. S. A. Mann at 4 p.m. on Fridays in January, beginning January 9th. Twelve lectures on the anatomy of the nervous system by Professor Le Gros Clark at 2.30 p.m. on Wednesdays in January and February, beginning January 7th, and also at 4 on Wednesday in February. Eight lectures in psychology by Dr. Henry Devine at 2.30 p.m. on Thursdays in January and February, beginning January 8th; these will be followed by a course of practical instruction. Six lectures on mental mechanisms by Dr. Edward Mapother, at 2.30 p.m. on Tuesdays in January and February, beginning January 20th. Four lectures and demonstrations on physiological psychology by Dr. Golla at 4 p.m. on Tuesdays and 2.30 on Fridays in February, beginning February 17th. There will also be a concurrent series of clinical lectures on nervous disorder in children: the origin and significance of symptoms and the neuroses; members of the course may attend these clinical lectures without paying an additional fee; a time table will be issued later. The second part of the course, covering the months March to May inclusive, will comprise lectures and demonstrations on morbid psychology and psychiatry by Dr. Edward Mapother; eight lectures on treatment by Sir Hubert Bond, Dr. Golla, and Dr. J. S. Harris; twelve clinical demonstrations in neurology by Drs. Golla and James Collier; eight lectures on the psychoneuroses by Dr. Bernard Hart; two demonstrations on abnormalities of the fundus oculi by Mr. Foster Moore; four lectures on mental abnormalities of children by Dr. W. Moodie; six lectures on the practical aspects of mental deficiency by Dr. F. C. Shrubsall; four lectures on the legal relationships of insanity by Sir Hubert Bond; six lectures on crime and insanity by Dr. Norwood East; and demonstrations on laboratory methods and the pathology of the central nervous system. The fee for the whole course is fifteen guineas or ten guineas for either part separately. Appointments as voluntary clinical assistants

at the Maudsley Hospital are obtainable without fee by practitioners specializing in psychological medicine, and can be held in conjunction with attendance at either part of the course for the diploma. Inquiries about the lectures should be addressed to the director of the Central Pathological Laboratory, Maudsley Hospital, Denmark Hill, S.E.5.

Clinic for Downham Housing Estate

The London County Council has completed negotiations for the provision of a special clinic building on its new housing estate at Downham in the south-eastern district. The Downham estate now consists of over 6,000 houses. Since 1927 a temporary school treatment centre has been provided here, to serve also the adjoining estate of Bellingham, with over 2,000 houses. Details have now been provisionally agreed for the erection by the Council as housing authority on a site in Downham of a clinic building to be let for use as a school treatment centre for the London Education Service, and sublet for use by the Lewisham Metropolitan Borough Council as a maternity and child welfare centre. The building is to comprise a lecture hall, seating 130 persons, and which can also be used as the main waiting room; also a vision room, with dark room attached, a minor ailments room, cubicles for use in ante-natal cases, a doctors' room, a dispensary, two dental surgeries, and a recovery room, together with all needful accessory accommodation. The estimated cost is £8,135.

Correspondence.

PYREXIA OF UNCERTAIN ORIGIN

SIR,—Dr. Chalmers's observations on this subject (October 25th, p. 711) seem to be as important and as accurate as his interpretations are shrewd. Cases such as those described by him have been familiar to me since 1917, and seem to constitute one link in experience between those diagnosed, on the one hand, as cases of "influenza" and, on the other, as cases of "poliomyelitis," "polioencephalitis," "encephalitis lethargica," and what not. Such cases made up a very large part of the epidemics of "poliomyelitis" in the United States during the great war, very many such were to be seen in London during the winter of 1917–18, just before, and during, the epidemics which were officially called epidemics of (1) encephalitis lethargica, and (2) influenza.

It is through the careful observation, in the field, of such cases, that we come to see the almost ludicrous nature of the insistence by systematists on the points of distinction between what they call certain "specific" diseases, each *sui generis*. Dr. Chalmers's cases represent, or stand for, an *abdominal* type of illness in which there is visceral as well as cerebro-spinal disturbance. The type in which the visceral disturbance is thoracic rather than abdominal is, of course, better recognized.—I am, etc.,

London, W.1, Oct. 25th. F. G. CROOKSHANK.

AVERTIN ANAESTHESIA

SIR,—Tribromethylalcohol, known under the proprietary name of avertin, was introduced as a general anaesthetic having advantages over many others because it could be administered by the rectum. It must be perfectly obvious that, if a general anaesthetic could be administered per rectum with safety and comfort to the patient, it would constitute an enormous advantage to the practitioner of medicine called upon in an emergency to undertake operative procedures. The doctor could administer the anaesthetic, satisfy himself that the patient was properly anaesthetized, and then proceed at his leisure to perform the necessary operation without having to trouble about an anaesthetist, very unfortunately, avertin is not such an anaesthetic.

In your issue of October 18th (p. 663) Sir Francis Shipway says that my paper on avertin at the Winnipeg Meeting of the British Medical Association is sombre and disappointing, and not a true representation of the facts as he sees them. It must remain a misfortune to everyone interested in the subject that Sir Francis was not present at the discussion of the paper so that he might have replied, not only to my views, but to those of other speakers, *more particularly* Americans, with large and varied experiences of the drug.

Sir Francis Shipway suggests in his letter that avertin anaesthesia may be valuable in combination with other anaesthetics, and in this respect I agree with him, but it is necessary to point out that, *if avertin has to be* given along with other anaesthetics, the principal object of its use for routine work has disappeared. An anaesthetic which can be given by the rectum *is invaluable*, but if it has to be given in conjunction with another anaesthetic it ceases to be of primary importance. Even as *an adjuvant* to other anaesthetics, avertin is now being rapidly superseded—in America and on the Continent, at all events—by sodium amytal and other synthetic drugs. If, as Sir Francis states, "it is premature to draw any comparison between the death rates of ether, chloroform, and avertin," it is also premature to regard avertin, even in combination with local anaesthesia or gas and oxygen, as the ideal anaesthetic.—I am, etc.,

Cambridge, Oct. 25th. F. B. PARSONS.

HYPERTONIC SALINE IN THE TOXAEMIAS OF LATER PREGNANCY

SIR,—The statement of Drs. Harding and Van Wyck, made four years ago and repeated this summer, that in the toxaemias of pregnancy protein is innocuous and that the salt in the food does the harm (*British Medical Journal*, October 11th, p. 589), is sufficiently interesting. It seems to me a dangerous statement, and should not pass unchallenged. It does not seem proved by the feeding *of eclamptics with high protein diet, even though* no aggravation of the symptoms, but, on the contrary, improvement, was noted. The patients were admitted after recovery from eclampsia for further observation—that is, after an interval had elapsed between the convulsions and the giving of the protein. During this interval a change of some sort, permitting such feeding—for instance, a restoration of an adequate blood flow through the liver and kidneys—must have occurred.

Even Drs. Harding and Van Wyck—judging from their case of eclampsia reported (Case IV)—do not give their high protein diet immediately after the fits have ceased. They allow an interval to elapse. In this case at least three whole days elapsed, on the day after the outbreak of convulsions water only was given, and on the next two days a "milk diet." Thus, Harding and Van Wyck apparently act on the assumption that immediately after the fits a high protein diet, even though salt-poor, cannot be borne, they must believe that immediately after the fits the viscera are inefficient—a view for which there are many good reasons. After some days, however, they found that such a diet could be tolerated, and indeed might be associated with clinical improvement. But clinical improvement with heavy meals postulates eliminating organs vigorous enough to cope with the absorption of the digestion products, and these authors suggest as much. "Portal lobular liver degeneration" in these cases, they say, is "not always present." We can reply that even if it were, provided the blood flowed adequately through the other parts of the lobules, and the cells in these parts were sufficiently numerous and healthy, no bad effects from ingestion of protein would occur. But if the intestinal blood surcharged with such products rushes through the liver, and the liver cannot deal with them—because either too many cells are rendered *effete*, or the blood rushes through too quickly even for healthy liver cells to catch and thus change these products—a clinical state comparable with that of a dog with an Eck's *fistula and fed with meat* is produced. That in the latter the associated convulsions are due to an increased absorption of salt will, I think, be difficult to demonstrate.

The patients who had recovered from eclampsia and who were given high protein diet were, moreover, kept in bed. Drs. Harding and Van Wyck point out *the highly* beneficial effect of rest in bed. So important do they regard this, with the general attention to hygiene, that they say they cannot legitimately ascribe the

improvement to the protein or fat in the diet Rest in bed can only act by reducing the work of the viscera and in facilitating that work The tone of all the muscles is reduced, and the blood flow through the viscera rendered less difficult The abnormal distribution and retention of water—the phenomenon associated with the toxaemia of pregnancy on which Drs Harding and Van Wyck lay the most stress, and which is only explained by a visceral impediment—tend to pass away with rest in bed because rest in bed markedly and especially affects the circulatory mechanism, facilitating the visceral work by removing to some extent the hindrance to the blood flow through visceral capillaries

There is another factor of moment—the state of the child As long as the child is intrauterine and alive, the portal blood flow, to meet the foetal demands, must continue increased compared with the non pregnant state, and as the child develops so must this portal blood flow progressively increase to meet these growing demands If the child dies in utero, this increased demand on the portal blood flow (the source of nutrition) and the associated increment of hepatic work immediately stop If the uterus is emptied the same result occurs If the toxaemia of pregnancy is due to maternal viscera having become impaired (as a result of the pregnancy), it is not surprising that with foetal death or emptying the uterus maternal improvement should occur if in pre-eclampsia the patient be fed well and foetal death should occur, a maternal improvement should not astonish us In this respect it is interesting to find that in their 1926 paper[1] Drs Harding and Van Wyck, speaking of their high protein feeding, say "The results are undoubtedly beneficial to the mother, though the child does not always escape death" That the eclamptic woman in whom labour rapidly supervened (Case IV) should have been "feeling well" and perhaps feeding well on the fourth day is not very remarkable

Drs Harding and Van Wyck's main contention that the taking of salt with food in a developing toxaemia will make the patient worse, and even produce eclampsia, is doubtless sound, but it only shows that the primary change in the toxaemia of pregnancy is a visceral change Thinking to dehydrate the oedematous patient or the one whose weight had unduly increased, they tried the effect of injecting intravenously hypertonic saline But this can only dehydrate the patient if the kidneys be efficient The kidneys are the especial organs concerned in this mechanism If the kidneys are sufficiently obstructed such an injection can only have as its effect an increase in the volume of the blood and a rise in blood pressure Thus, in a case of normal pregnancy, these authors found no rise in blood pressure and no albuminuria the patient simply complained of thirst and passed two fluid stools In a patient with a mild toxaemia, the blood pressure fell and the albuminuria decreased, but the patient felt sick and had headache and was given milk diet for three days In the third case, also one of "mild toxaemia," the blood pressure rose, the albuminuria increased, and the patient vomited She was given milk diet for three days when labour supervened The fourth case, a primigravida, "admitted one convulsion" with marked albuminuria was injected ten days later, the blood pressure rising and the albuminuria increasing The very next day she was injected again The blood pressure rose greatly headache and epigastric pain appeared, and the patient vomited apparently several times In the evening convulsions appeared and labour

If Drs Harding and Van Wyck's interpretation of their facts is sound, some sign indicative of a toxaemic state should have been induced in the case of normal pregnancy—a primigravida, eight months pregnant—by injecting hypertonic saline It did not do so The evidence on their facts thus is that salt per se is not the cause of the toxaemia of pregnancy, it does not induce it, though it may increase it Inquiry may show that during the war the food in Germany was prepared with more salt than usual On the other hand it does not seem that food per se is the cause of this disease Many women as Whitridge Williams has pointed out eat largely when pregnant, and the only effect is a large child He makes no note that these individuals restrict their salt, but he emphasizes that many of them lead idle or easy lives

The more one reflects on this matter and examines it testing it in the light of new observations, the more certain does one become that the toxaemia of pregnancy has a physical basis It is activity which produces this disease and eclampsia—acting, as I have urged, by obstructing the blood flow through the viscera Just in so far as food is necessary for general activity, and is taken for this, does it come into play The relative starvation of the German women during the war produced a weakness which has been commented on, and which itself explains the fall in the incidence of eclampsia among them The teaching that the pre-eclamptic woman—often remarkable for her physique and obvious strength—should be starved, promulgated by many noted obstetricians and especially of the Dublin school, weakening her as it does (and as do morphine, chloroform, and bleeding in eclampsia), must be considered unsound, and the only safe course to adopt—I am, etc

PERSONNEL OF A RADIUM CLINIC

SIR,—From Mr Fitzwilliams's letter in the *Journal* of October 11th (p 621), some of your readers may have drawn the conclusion that surgeons have made a thorough trial of x ray treatment in cancer, and that the results of these detailed and extensive observations "have been disappointing to surgeons" This is far from being the case

Dr Russell Green has shown (October 25th, p 710) that there is statistical evidence strongly supporting the combined use of x rays and radium in cervix cancer, and the combined use of x rays and operation in breast cancer But—for example, in the case of breast cancer—there are as yet available very few observations which tend to show the relative value of operation as compared with x rays or radium, or a combination of the two, in point of fact the thorough trial of radiation methods in surgical (apart from skin or gynaecological) cancer implied in Mr Fitzwilliams's disparaging reference to x rays has nowhere yet taken place

Surgery and radiation are both local methods of treatment As such they are likely to be most beneficial when applied to patients with early localized growths, I have shown this in respect of operable breast cancer when treated with x rays or surface radium[1] Since surgeons hardly ever send on to the radiologist early cases of cancer for x-ray or surface radium treatment, but as a rule the inoperable or recurrent patients, the only way in which these methods can be truly evaluated is for the patients to have access directly to the radiologist (radiotherapist) This is customary in some centres such as Stockholm where radiology has won for itself an autonomous position In Great Britain, however, it is possible only where the radiologist has beds of his own, as is the case at the Middlesex Hospital where the generosity of an anonymous donor has allowed six beds to be set aside for the non-operative treatment of cancer, the special intention of this benefaction is that early cases where there is a wish to avoid operation or there is a contraindication to operation, will be able to have purely radiological treatment, by x rays or by surface radium, or by both combined—I am, etc,

London W1, Oct 20th J H DOUGLAS WEBSTER

[1] *Lancet*, 1928 i 1 1000 ii 1 6

IONIZATION FOR COLITIS

SIR,—I have been much interested to read in your issue of October 18th the article by Dr Julius Burnford on the treatment of ulcerative colitis by ionization As long ago as November 4th, 1905, I published a letter in the *Lancet* on the treatment of a single case of colitis by ionization, and in the *Lancet* of April 22nd 1911 a paper of mine on further cases was published dealing fully with the question of technique, results, etc Dr Burnford's results confirm my own experiences, and I have seen no reason to alter the technique which I described in 1911.

[1] *Lancet*, 1928 i 1 1000 ii 1 6

I merely write this letter to congratulate Dr. Burnford on developing a treatment which I believe I was the first to describe twenty-five years, and subsequently nineteen years, ago. It has always appeared to be difficult to understand why the ionization treatment of both mucous and ulcerative colitis has not been adopted as part of the routine therapy of this disease.—I am, etc.

Cheltenham, Oct. 22nd. J. CURTIS WEBB.

ANAESTHESIA FOR THROAT OPERATIONS

SIR,—I, too, am interested in the recent correspondence on anaesthesia for throat operations, for in 1923 I was adopting almost the same procedure as recommended by your correspondents for anaesthetizing patients for dissection of tonsils.

Using a Boyle's apparatus—after a preliminary injection of morphine and atropine—I induced with gas and oxygen, supplemented with ether or a mixture of ether and chloroform as required. As soon as the patient was fully anaesthetized, I passed a soft, fairly large-bored rubber catheter through the nose into the trachea, and continued the anaesthetic with the same apparatus. The surgeon's dresser followed the knife with a fine tube attached to a suction apparatus, so there was never any bleeding into the mouth or throat. With the correct mixture the method was automatic: the patient's colour remained healthy, the respirations, as shown by the rise and fall of the bag, were quiet and regular. These operations were always performed in a darkened theatre, except for the light of the surgeon's head-lamp.

I have always considered the method ideal for many dental operations, but I have never had the opportunity of using it in this field of work. The usual advantages of gas and oxygen—quick recovery and no after-symptoms—were the rule.—I am, etc.,

WRIGHT LAMBERT, M.R.C.S., L.D.S.

Brentwood, Essex, Oct. 25th.

MEMBERS OF THE ROYAL COLLEGE OF SURGEONS

SIR,—A resolution advocating some representation of the Members on the Council of the Royal College of Surgeons of England has been passed by large majorities at forty-one consecutive annual meetings of Fellows and Members. On November 21st, 1929, a resolution of this character was passed almost unanimously, and the Council replied:

"No evidence has been submitted to the Council that the change in the constitution of the College advocated in the resolution is desired by any considerable number of the Members of the College and the Council is therefore not prepared to reopen the question at present."

In order to elicit their desires a poll of Members resident in the United Kingdom and the Irish Free State is being taken by the Society of Members. Lack of financial support prohibits a total poll. Some 12,500 cards have been issued and nearly 7,000 replies received. May I ask all those who have not returned their cards to do so promptly, since it will be necessary to close the poll on or about November 7th. These should be sent to Dr. Pinto Leite, 25, Fellows Road, London, N.W.3. It is hoped that all Members will respond, and thus show an interest in their College and afford to the Council the evidence desired.—I am, etc.,

ERNEST F. WARE,
President of the Society of Members.

London, W.1, Oct. 27th.

TRAINING OF PUBLIC HEALTH WORKERS

SIR,—The leader on the training of public health workers in your issue of October 18th appears to me to require in the last paragraph a considerable amount of explanation. Whilst the whole world appears to be unanimous in the opinion that examinations are a very poor means of discovering ability, it is so far the only practicable method, except lengthy and perhaps disastrous trial. This being so, I fail to understand the writer's point when he says that posts as sanitary inspectors should be open to men and women who, though of good education, cannot pass examinations. Who is to assure the engaging authorities that a man who cannot pass an examination is in fact of good education? Good education in the required subjects is not apparent except upon long and intimate acquaintanceship. A sanitary inspectorship is no longer considered an admirable post for the mayor's gardener or coachman.

In my opinion, so far from it being good business to lower the educational standard of sanitary inspectors it should be the aim of the governing authorities to raise it considerably. With every day that passes a sanitary inspector's work is rapidly becoming a work which demands a more scientific training, and the standard which should be aimed at should be the possession of the B.Sc. of recognized universities covering the necessary subjects. This would necessarily imply a good general elementary education. If you weaken one stone of the edifice of public health, as it is shaping to-day you weaken the whole structure, and the sanitary inspector's work, dealing with questions of food, housing, water supply, and infectious diseases is the foundation of all public health work. The better that foundation, the better the building.—I am, etc.,

V. F. SOOTHILL,
Medical Officer of Health and School Medical Officer.

Norwich, Oct. 24th.

WORKERS' HEALTH EDUCATION

SIR,—The *British Medical Journal* of October 18th publishes five original articles on health training, and the first is by Professor J. G. Fitzgerald of Toronto, who includes under health workers "university graduates in medicine, arts, science, engineering, agriculture, public health nursing, social science, and those who have received training in the duties of a sanitary inspector." Professor Fitzgerald and your editorial rightly emphasize the importance of this vocational aspect of modern health training. May I as a past public hospital and health officer stress the even greater importance of mass health training of the minds of the workers? Without an educated people, health workers cannot apply efficiently a thousandth part of what is known of hygiene, and medical science generally, to personal and communal health. One attractive method I have seen on the Continent and in the Soviet Union of obtaining the interest of apathetic workers is that of free daily demonstrations to the public, in health museums, by experts of all branches of preventive and social medicine, supplemented by exhibits, etc. The socialist workers' health movement, of which I enclose a circular, aims at interesting the workers personally in their own health until a health conscience and reasonable knowledge is common property.—I am, etc.,

F. G. BUSHNELL,
Honorary Organizing Secretary Plymouth Workers' Health Committee.

October 20th.

NECROPSIES BY GENERAL PRACTITIONERS

SIR,—Some years ago a Manchester coroner, on taking office, decided to ask the practitioner in charge of the case under investigation to perform the post-mortem examination. This practice was carried out for a few months. In a busy practice at the time, I must say I did not welcome the prospect of these necropsies, chiefly because of the short notice that had to be given to the practitioner. To perform my first post-mortem for the coroner I had to drag myself out of bed before 7 A.M. in order that the evidence should be in his hands before 10 A.M. My first post-mortem was held one Sunday at midnight in a draughty ill-lit police mortuary, with temperature well below freezing point. I was not altogether ill pleased when I learnt that it had come to the ears of the coroner that one general practitioner, who had sent in a full report of his necropsy, including a dissection of the brain, had performed the whole operation with his pocket knife. The coroner discontinued the practice, and selected a rota of young specialists.—I am, etc.,

ALFT. PRIEST.

Manchester, Oct. 22nd.

PHYSIOLOGICAL RESEARCH AND CLINICAL MEDICINE

SIR,—In your issue of October 11th Lord Moynihan rebukes physiologists for making journeys into countries far from the realm of clinical medicine, in particular, he holds them blameworthy for having failed to bring any help to the treatment of Raynaud's disease and other allied conditions Since in acetyl choline the physiologists have only recently brought back from that same "far country" the very remedy for which Lord Moynihan asks, the reproach appears to be untimely, to say the least It is difficult to foretell of even the most academic piece of physiological research that it may not in the long run become as "nominal" as even Lord Moynihan could wish —I am etc,

Wolverhampton Oct 24th. S C DYKE

STAFFING OF MATERNITY AND INFANT WELFARE CENTRES

SIR —In to-day's issue of the *British Medical Journal* the maternity and child welfare committee of the city of Birmingham invites applications from medical women for the post of assistant medical officer for maternity and child welfare *The appointment will automatically terminate in* the event of the medical officer's marriage If this condition is made consistently the medical direction of maternity and infant welfare will be confined to men, spinsters, and unmarried mothers Is it advantageous that married mothers should be excluded from maternity and infant welfare work?—I am, etc,

Birmingham Oct 27th CRANSTON WILKER

Obituary

THE LATE DR E D WHITEHEAD REID

SIR CHARLES GORDON-WATSON writes

The tragic death of Whitehead Reid at the early age of 47 is a terrible blow to a very wide circle of devoted friends It was my good fortune to teach Reid as a student, to serve with him in France, to be associated with him from time to time in surgical practice, and to claim him as a friend

He succeeded his father in general practice in Canterbury Had he chosen, he might have made a big mark in surgery He gave to general practice exceptional ability, intense enthusiasm, and an amazing capacity for work. In all branches of his work he kept right up to date, and found time to study at the fountain head new lines of treatment Recently he had made an intensive study of radium therapy, and had obtained a gift of radium for his hospital Whatever Reid undertook to do *he did thoroughly* His clinical notes on cases were a joy to the consultant No likely line of investigation was omitted or unrecorded, though his time was too seldom his own As a surgeon he was in great demand over a wide area, and his attractive and modest personality made him beloved wherever he went Despite a busy practice and numerous public appointments, he found time to master the technique of radiography and electrotherapy, and to lecture regularly to the St John Ambulance Brigade

Reid had a fine athletic figure, and was a good all-round athlete At Tonbridge School he shot in the Bisley eight At Cambridge he was secretary of Christ's Athletic Club He rowed in the College eight, and as a sculler was noted for his style Though he just failed to get a *blue*, he was a beautiful high jumper, and often competed in high jump hurdles, and sprints at the London Athletic Club where he won many prizes At Bart's his enthusiastic efforts as secretary (and later as captain) of the athletic club brought the shield back to the hospital in 1908 In 1919, after four years' war service abroad Reid took up flying, and was quick to realize the importance of civil aviation *and the value of civil pilots* as auxiliaries to the Air Force He was a pioneer in private ownership, and was known to everybody in aviation He became an expert pilot and as flight lieutenant to a London bombing squadron trained annually with the Air Force, and took part in bombing raids on London Recently he had become a gliding enthusiast, and was returning from a gliding exhibition when he met his death

Reid's energetic and crowded life, which came to a tragic end on Trafalgar Day, stands out at a time when enterprise and effort are too often lacking and Nelson's *famous* signal is seldom remembered A master pilot may meet misfortune in the air Those who knew Reid's record in the air, and knew the man, know well that no lack of foresight no want of skill or care, contributed to the cruel crash that closed the young life of his passenger and cut short his own versatile career The sun shone its brightest as Douglas Reid passed to his rest, escorted by his brother officers of the Royal Air Force, and followed, between the rows of respectful citizens, by some two thousand friends who had filled the cathedral to the full to pay a tribute to his memory A last tribute, a last post, that could not fail to soften a widow's grief

---

We have just received news of the death of ALFRED WITHERS GREEN, M R C S, L R C P, at Hobart, on the eve of his seventy seventh birthday He had suffered about Christmas time last year from coronary thrombosis, since when he had lived more quietly, and was not troubled The son of Mr Abbott Green, at one time Inspector-General of Hospitals, Bengal, he was born at Dacca, and came to England as an infant before the Suez Canal was completed Educated at Bedford Grammar School, where he excelled at Rugby football and cricket, he went on to Guy's Hospital, but had to begin practice in 1876 before completing his M B, B S For over forty years he conducted a busy practice in the City of London, and experienced the changes that occurred as London expanded and the city became non-residential In early years his leisure time was spent in connexion with the London Medical Mission, and to medical missionaries he was always ready to offer hospitality and assistance Dr Withers Green *did valuable work for the Poor Law Medical Officers'* Association, and on committees in connexion with the Insurance Act For several years prior to the war he would conduct parties round the haunts in the City of Dr Samuel *Johnson, Goldsmith, and Garrick, and thereby formed a* wide circle of friends both *in and out of the profession* In 1915 when London hospitals were depleted of their staff on active service, he took up anaesthetics and ably assisted them Not until after the war did he retire and join one of his sons in Tasmania

---

With the death, on October 26th, of Dr FREDERICK WILLIAM SPURGIN, in his ninety fourth year, London has lost its oldest medical practitioner Born at Harlow, Essex, in 1837, he was educated at the Mercers' School, after leaving which he was apprenticed, as was then the custom to his uncle, Dr Charles Spurgin a practitioner of great repute in East Anglia, and a close friend of Sir Astley Cooper Frederick Spurgin entered the Middlesex Hospital, and after a brilliant career as a student, during which he carried off most of the prizes, he obtained the diplomas L S A and M R C S in 1861, adding later the L R C P of Edinburgh He served as resident surgeon (now house surgeon) at the Middlesex Hospital, and was then appointed resident casualty surgeon at the Poplar Hospital, where his skill in surgery was much appreciated Commencing private practice in Hammersmith he rapidly built up a successful practice He removed to Henrietta Street, Cavendish Square, in 1869, when he purchased succession to an old-established practice and o began his long association with Marylebone He was appointed divisional surgeon to the local police and held the position *for forty-seven years—a record in police* service With numerous appointments and a large and busy private practice, Dr Spurgin was for sixty years one of the best known practitioners in the West End He was a witness in his time in many well-known cases including those known as the Harley Street mystery in 1880 and the George Street murder in 1883 When about to retire from active practice in 1914, the great war and his son's absence on military duties caused him to continue in harness until 1919 Active and vigorous to within a few months of his death, Dr Spurgin was a well known

figure in Marylebone, and his passing will leave many regrets among the older inhabitants, by whom he was much respected and loved He was endowed with very sound judgement and a keen diagnostic sense, and his opinion was much valued by his colleagues He was a celebrated angler and a zealous Freemason being by some years the oldest member of his lodge, which he joined in 1869 Of his family of five children a daughter and a son survive him, the latter is still carrying on the practice established more than a century ago

Medical Notes in Parliament.

Opening of New Session

A NEW session of Parliament was opened by the King on October 28th The Speech from the Throne announced that bills will be submitted for raising the age of compulsory school attendance, for modifying and extending the law relating to town planning and the preservation of rural amenities, and for the amendment and consolidation of the Factory Acts Other important bills were also promised The House of Commons began the debate on the Address, which will continue next week

Universities and Colleges.

UNIVERSITY OF LONDON

FOUR lectures on the respiratory functions of the blood will be given by Dr L E Barlow at University College, Gower Street, W C, on November 10th, 17th, 24th and December 1st, at 5 p m Dr W Robson will give a course of four lectures on protein metabolism at King's College, Strand, W C, on November 13th, 20th, 27th and December 4th, at 5 p m Admission to the lectures is free, without ticket

The Graham scholarship in pathology has been awarded for two years to C L Oakley M B, B S, on the recommendation of the School Committee of University College Hospital Medical School

UNIVERSITY OF ABERDEEN

DR WILLIAM G EVANS, senior resident medical officer, Mount Vernon Hospital for Cancer, Northwood has been appointed McRobert lecturer in malignant disease and radium officer at the Aberdeen Royal Infirmary

UNIVERSITY OF EDINBURGH

ON the occasion of his installation as Chancellor, Sir James Barrie delivered a characteristic address to the students and conferred honorary and other degrees, as well as diplomas upon the successful candidates The Diploma in Public Health was conferred upon the following

Katharine H Aitchison I M Davidson Martha Keith R J A Lavoipierre D Lees I F Macleod Barbara K Nicholson Jean Suther land Helen A Wright

UNIVERSITY OF BOMBAY

DR ABRAHAM S ERUKAR honorary physician to King Edward Memorial Hospital Bombay has been elected dean of the Medical Faculty of Bombay University

The Services

HONORARY PHYSICIANS TO THE KING

COLONEL G I THORNTON V C T A (A D M S 43rd Wessex Division) and Lieut Colonel (temporary Colonel) W P MacArthur D S O R A M C promoted to Brevet Colonel, have been appointed honorary physicians to the King in the place of Colonel A B Soltau T D deceased, and Lieut Colonel (Brevet Colonel) E Ryan C M G, D S O, R A M C (retired)

No 14 STATIONARY HOSPITAL

The eighth annual dinner of the medical officers of No 14 Stationary Hospital will be held on Friday December 12th at the Trocadero Restaurant Piccadilly at 7 15 for 7 45 p m Colonel J C P Ryan D S O will be in the chair The price (including wines) Dr H Letheby Tidy 2 Devonshire Place W 1, is again acting as honorary secretary

DEATHS IN THE SERVICES

Lieut Colonel Arthur Samuel Arthur O B E R A M C (ret), died at Blackhall Wood, Carlisle on September 9th aged 53 He was born on March 16th 1877 and was educated at the Newcastle School of Medicine graduating as M B and B S of Durham University in 1898. He served as a civil surgeon in the South African war for over two years and was for some time in charge of the native refugee depot in the Orange River Colony He entered the R A M C as lieutenant on January 30th, 1904, becoming major on July 1st 1915 and retired on account of ill health with a step of promotion on May 23rd 1921

Lieut Colonel Hugh Watts I M S (ret) died in June last aged 50 He was born on September 18th 1879 was educated at St George's and Guy's and took the M R C S and L R C P Lond in 1903, also graduating in the same year as M B and B S Lond After serving as resident obstetric surgeon and assistant house surgeon at Guy's Hospital and as clinical assistant at the Evelina Hospital for Sick Children he entered the I M S as lieutenant on January 30th 1904 became lieutenant colonel on July 30th 1923 and retired on May 10th, 1928 When he entered the Service he gained the Montefiore prize and medal for military surgery at the Army Medical School

Medical News.

THE Lloyd Roberts Lecture at Manchester University will be delivered on Friday, November 7th, at 4 15 p m, by the Right Rev E W Barnes, D D, Bishop of Birmingham, the subject will be heredity and predestination

"SCIENCE and modern industry" is the subject of the Norman Lockyer Lecture, 1930, which will be given by Professor Sir William Pope, D Sc, F R S, in the Gold with Hall, Foster Lane, E C, on Thursday, November 13th, at 4 30 p m The Rt Hon Sir Samuel Hoare, Bart, President of the British Science Guild, will take the chair at the lecture, for admission to which there will be no charge Tickets may be obtained on application to the British Science Guild, 6, John Street, Adelphi, London, W C 2.

AT a meeting of the Pharmaceutical Society of Great Britain, to be held in the lecture theatre at 17, Bloomsbury Square, W C, on Tuesday, November 18th, at 8 30 p m a lecture will be given by Mr Wilfred H Linnell, Ph D, M Sc on the purity, standards, and tests of medicinal substances Scientific friends of members will be welcomed

AT a meeting of the Royal Sanitary Institute on Saturday November 15th, a demonstration will be given at the Field Laboratories, Milton Road, Cambridge, on recent research in connexion with animal tuberculosis, by Professor J Lissell Buxton, and the staff of the Department of Animal Pathology of the University of Cambridge The chair will be taken at 10 30 a m by Dr James Fenton

THE Fellowship of Medicine announces that the following two lectures for the M R C P course will be given at 8 30 p m at the Medical Society, 11, Chandos Street, Cavendish Square on November 4th Dr Maurice Cassidy will speak on auricular fibrillation, and on November 7th Dr O L V de Wesselow will discuss anaemia Tickets may be obtained at the lecture room On Monday, November 3rd a free lecture will be delivered at 4 p m by Dr B T Parkes Smith on recent advances in the diagnosis and treatment of coronary thrombosis A course of free lecture demonstrations on diseases of infancy and childhood will be given at St John's Hospital, Lewisham, by Dr J Gibbons on Monday at [illegible] at 4 30, commencing on November 3rd and continuing at fortnightly intervals thereafter until February 16th Free clinical demonstrations will be given during the week as follows at St John's Hospital Leicester Square, on November 3rd, at 2 p m, by Dr W Griffith at the Metropolitan Hospital, Kingsland Road, E, on November 4th at 2 p m, by Dr J W Linnell and by Mr L J Jefferiss The subjects of special courses in November are as follows venereal disease (November 3rd to 29th), medicine [illegible] and gynaecology (November 10th to 29th) neurology (November 10th to December 13th), proctology (November 24th to 29th), ante natal (November 5th, 12th, 19th 27th) diseases of the chest (November 17th to 23th [illegible] and tickets for all courses may be obtained from the Secretary of the Fellowship, 1, Wimpole Street, W 1

DR F E FREMANTLE, M P and Dr Marion Phillips [illegible] have been appointed members of the committee appointed by the Minister of Health and Secretary of State for Scotland to inquire into and report upon the present working of the Rent Restriction Acts (excluding the special provisions relating to agricultural cottages) and whether any, and if so what, additions or amendments should be made to them

THE post graduate courses at the Royal Northern Hospital, Holloway Road, N 9, will be resumed on Tuesday November 4th at 3 15 p m when Mr L E Barrington Ward will give a demonstration of surgical cases The course will be continued till December 16th when there will be a break for the Christmas vacation and will recommence on January 20th, 1931, and continue weekly till March 17th From Monday December 1st, till Friday December 5th, an intensive course will be held daily The lectures and demonstrations are open to all practitioners free of charge Full particulars can be obtained on application to Dr L G B Calvert at the hospital

THE Minister of Health received a deputation on October 24th from the Standing Joint Committee of the National Women s Organization The deputation was introduced by Dr Marion Phillips M P , and urged the importance of early steps being taken by the Government to set up a national maternity service stressing the desirability of full control of such a service by the health authorities The Minister said in reply that he proposed to approach local authorities immediately and urge upon them the importance of an improvement and extension of their present maternity services He also said that he intended to discuss with the local and other authorities affected including the doctors and those concerned with health insurance the question of a national scheme but it had to be realized that these discussions would inevitably take time

THE Nursing Sisters of St John have recently set aside their home at Deptford for the establishment of a specialized maternity centre, from which midwives attend mothers in their own homes act as maternity nurses under local medical men and train students in practical midwifery Ante natal and post natal clinics are held regularly with an obstetric consultant in attendance A group, representative of the medical profession, midwives and friends were present on October 25th when the Bishop of Woolwich visited this centre for the purpose of dedicating a new altar which had been given for the chapel, in memory of Sir Francis Champneys, whose great work for midwives is so widely known

THE annual St Luke s Day service arranged by the Portsmouth Division of the British Medical Association was held on October 17th in All Saints Church Landport, the lessons being read by two members of the medical profession The Bishop of Portsmouth delivered an address in which he emphasized the importance of character in connexion with the ministration of the sick The St Luke s Day service, he said, was a recognition of the contact between the creative healing force and the practical activities of the medical servants of God

HEALTH week was observed in Port of Spain, Trinidad, from October 11th to 18th The Governor opened an exhibition illustrating the nutritive values of various kinds of food the production of clean milk the rearing of healthy children and the campaigns against malaria tuberculosis enteric fever and other diseases Dr G H Masson, medical officer of health delivered an address in which he commented on the remarkable decline in recent years in tuberculosis and enteric fever He appealed for the establishment of a permanent health and hygiene museum

A CONFERENCE on Mental Welfare will be held in the Great Hall of the British Medical Association House, Tavistock Square W C on Thursday Friday and Saturday, December 11th 12th, and 13th An opening address will be given by the Right Hon Arthur Greenwood M.P , Minister of Health and subjects for discussion will include matters relating to the Mental Treatment Act, the Mental Deficiency Acts, and school reorganization in connexion with the education of defective or retarded children Further information may be obtained from the secretary, Central Association for Mental Welfare 24, Buckingham Palace Road, S W 1

THE third International Congress of Radiology will be held in Paris at the end of July, 1931, the sections being roentgen diagnosis roentgen and curie therapy radio biology radiophysics natural and artificial heliotherapy and medical electrology

THE second Congress of the Federation of the Latin Medical Press was recently held at Brussels under the presidency of Professor Maurice Loeper of Paris on the occasion of the celebration of the centenary of the independence of Belgium

THE report of the Queen Alexandra Sanatorium Fund for the year 1929–30 shows that the number of grants allotted to assist patients receiving treatment for tuberculosis at Davos was forty four a decrease of nine on the exceptional total in the previous year Of the patients so assisted eleven resided in sanatoriums thirty one in small hotels or pensions, and two in private families Grants were paid at the rate of £2 a week and the average stay during the year was twenty two weeks Further information can be obtained from the honorary secretary of the Fund, Mr D Vesey, 97, Warwick Road, Earl s Court, S W 5

ACCORDING to the *Canadian Colonizer*, published by the Canadian National Railways, a new plan of co-operative health services is being operated in the Province of Saskatchewan under Provincial Government direction About three quarters of the population of Saskatchewan is rural, and not a small proportion live in outlying districts The problem of bringing health services to these people is a considerable one Recently the Government by legislation made provision whereby communities could obtain the services of doctors under a co-operative plan One scheme empowers a rural municipality to make a grant to a medical practitioner as an inducement to him to take up his residence and practise his profession in the community, a grant of money up to $1,500 being made to him for this purpose The other plan is that which makes it possible for rural municipalities, by vote of the residents of the area, to engage a full time practitioner at a salary not exceeding $5 000 yearly In this case the doctor acts as the community doctor giving free medical service to all ratepayers and their families Thirteen municipalities are trying out the first scheme and nineteen districts the second

WE have received the first part of *Fisiologia e Patologia della pelle* which contains five papers on various aspects of dermatology read before the second medical congress of S Pellegrino on June 29th and 30th by Professors C Foà, A Valenti M Truffi, M Ascoli and L Devoto respectively

A CANCER institute, consisting of a laboratory and a hospital of 40 beds has recently been founded at Tokyo

PROFESSORS HENRI FRÉDÉRICQ of Liège and J Varnieuwe of Ghent have been nominated members of the Royal Academy of Medicine of Belgium

DR FÜLLEBORN has succeeded Professor Nocht as director of the Institute for Tropical Diseases at Hamburg

QUERIES AND ANSWERS.

ADMINISTRATION OF MALE FERN

"C W B" would be glad of suggestions for the best mode of administration of male fern to a child of 3 years

PREMATURE GREYNESS

"G E McC" asks for advice on the treatment of a girl of 22 years whose hair for some years has gradually turned quite grey Formerly it was jet black Her mother had a similar experience

CONSTIPATION IN A CHILD

"K A" writes I should be glad of suggestions for the treatment of constipation in a boy of 6 years He is an active child always on the go an irrepressible chatterbox and sometimes has restless nights The condition has been present since birth and ten is to become more trouble some All the usual methods have been followed—that is inculcation of a regular habit and the eating of fruit and vegetable In addition daily doses of paraffin or petrolagar have been necessary and at intervals occasional doses of cascara evacuant or other aperient The child never passes a motion without some such artificial aid and has occasionally missed two or three days even when taking them

EPONYMY

"J G B" asks what is the technical expression for naming a disease after the person who first describes it—for example, Bright's disease?

*** The *Concise Oxford Dictionary* defines "eponym" as 'one who gives his name to a people, place, or institution. So 'eponymous.'' In the *New English Dictionary* under examples of the use of the word "eponymy,' we find—'The tendency of rude races to eponymy,' and again, "after the fashion of eponymy so prevalent among Asiatic nomads." It appears, therefore, that the troublesome practice of calling symptoms and diseases after people's surnames should be described as "eponymy." A longer, but perhaps more exact, term would be "eponymous nomenclature."

ALUMINIUM COOKING VESSELS

"L S" writes in reply to the query under this heading published on October 11th (p. 626) "W S M's" belief that sodium bicarbonate has a bad influence on aluminium utensils is correct. It should, however, be kept in mind that aluminium cooking utensils are invariably cleaned with soda or a material containing soda, such as soap, special cleaning powders, etc., and that that is at least as bad as the shocking habit of adding sodium bicarbonate in the process of cooking in aluminium utensils. On buying vessels made of aluminium the public is sometimes told not to have them cleaned with soda, but is invited to use a "special" soap. It seems obvious, however, that this, too, contains soda.

INCOME TAX

Removal to other Premises

"W A J" removed from a smaller house into the house of a neighbouring practitioner, which had fallen vacant. His claim to deduct as a professional expense the cost (£40) of repairing and redecorating the professional part of the new premises has been refused.

*** A similar question was discussed in the case of the Granite Supply Association, Ltd., v. Kitton, and it was held that the expense of removing to more commodious premises is not deductible. The expenses in question seem to have arisen out of the removal, and therefore to fall within that ruling. Possibly the inspector of taxes may feel able to allow—the equitable grounds are strong—an amount equal to the cost of redecorating the professional portion of the *old* premises, after making a reasonable allowance for any further 'life' in those decorations.

Double Assessment

"SCOTEX" has received a notice of assessment, showing him to be charged on £67 under Schedule E and £119 under Schedule D—in fact, his earnings have been £52 from practice and £67 as locumtenent.

*** It seems clear that an error has been made and that the £67 has been assessed twice—that is, as a separate amount and also as part of the £119 assessed under Schedule D. If "Scotex" writes to the inspector of taxes whose address is given on the notice no doubt the assessment will be amended. On the facts he is not yet liable to payment of tax.

LETTERS NOTES ETC

PYLORIC CANCER: REMISSION OF SYMPTOMS

DR H. LAWRIE (Ramsbottom) writes: With further reference to the question of Wicklow (September 13th, p. 455), the following case *may be of interest*. *An unmarried woman, now aged 70,* consulted me early in 1924 about epigastric pain coming on one to two hours after meals and relieved by food, duodenal spasm and possibly ulcer were suspected. In the middle of March that year five or six nodules the largest about the size of a large horse bean were detected in the angle between the left clavicle and sterno-mastoid tendon. These were not painful, but hard and well anchored in the surrounding tissues, and were strongly suggestive of lymphatic gland infection by malignant disease elsewhere. The gastric symptoms pointed to the seat of the primary growth being near the pylorus. The patient's mother had died of cancer of the throat. I dissected out the largest of the nodules which was reported to be a carcinomatous lymphatic gland the position of the primary growth not being determinable. At six weekly intervals she attended the Radium Institute for one year and thereafter at less and less frequent intervals until a year ago the nodules disappeared under treatment. In December 1925 the gastric symptoms which had meanwhile been more or less chronic were somewhat exacerbated and early in January 1926 the patient developed a large cold abscess on the inner aspect of the right arm just above the elbow joint. After evacuation it healed quickly and the gastric symptoms diminished steadily disappearing by the middle of the following month. In December 1927 she had an attack of bronchitis, following influenza again in December 1928 an attack of bronchitis and in February and March 1929 bronchitis, following influenza once when she has enjoyed uninterrupted good health. On October 5th 1930 she was in excellent health and there was no trace of any nodule in the neck. No treatment beyond radium and the ordinary measures to circumvent symptoms was adopted. In view of the transient notoriety of Coley's fluid in the treatment of cancer, and since the patient became rapidly well after the septicæmic abscess, I regret very much not having had cultures made from the pus.

TENNIS-ELBOW

DR RODERIC O'CONNOR (San Francisco) recalls Mr W. H. Trethowan's letter on tennis elbow in the *Journal* of December 28th, 1929 (p. 1218), and describes a procedure which he adopted in his own case with prompt relief. He writes: Inasmuch as *the condition is the result of an overworking of the muscles* involved in gripping, it seemed to me that a procedure calculated to lessen that strain was in order. Therefore I taped with adhesive the grip of my racket till it was so large that my finger tips failed to meet by more than a half inch. The condition *which had* been present eight or nine months, disappeared in less than two weeks, never to return, although I did not stop playing. In my own case the grip was evidently too small, calling for too tight a muscle action to prevent slipping.

PREVENTION OF BLINDNESS

A VOLUME of the *Proceedings* for 1929 of the Annual Conference of the National Society for the Prevention of Blindness gives an account of the organizations and policies which various States in America have adopted to safeguard the eyesight of their citizens. Among the subjects discussed at the conference were educational propaganda by the distribution of literature and by the establishment of diagnostic and advisory clinics, eye testing for the school and pre-school child, safety codes in industries harmful to vision, and the co-ordination of the work of the society with that of official and voluntary agencies. In the section of social hygiene the necessity for the early diagnosis of syphilis was frequently emphasized, and the subsequent discussion proved of some decided expressions of opinion in favour of compulsory attendance for adequate treatment. Other papers included addresses on ophthalmia neonatorum and on the etiology and prevalence of trachoma, which was stated to be a serious public health problem throughout the United States. In contributing to this discussion Dr. Ernst Fuchs referred briefly to the successful treatment of trachoma in England, and advocated the introduction of effective measures in several of the southern countries, such as Abyssinia, where, he said, perhaps a half or a third of the population was affected. His own paper on the subjective symptomatology of ocular disorders is published elsewhere.

MEMORIAL TO DR JANET HOARE

THE South Harrow Baptist Church has issued a public appeal for £240 to endow a bed at the Rahimatpur Women's Hospital, Palwal, India, as a memorial to Dr. Janet Hoare, who died at the hospital a few months ago at the outset of a promising missionary career. Dr. Hoare, who was 27, graduated M.B., B.S. *in* 1927 and became a Fellow of the Royal College of Surgeons in the same year. In 1929 she took the degree of M.D. at London University, being awarded a gold medal for gynæcology. Before proceeding to India at the beginning of this year she was house-surgeon at the Royal Free Hospital and at the General Hospital, Ashton-under-Lyne, and was associated with the Islington Medical Mission. The appeal contains many spontaneous tributes to her strength of character and generous disposition. Palwal is a small country town to the south of Delhi. In the absence of a Government medical service the Baptist Mission has provided treatment for the women of the town and district for nearly thirty years. Its work is now centred at the Rahimatpur Hospital, which has forty-two beds, and maternity and child welfare departments.

TO MEDICAL BOOK BUYERS

ANY medical practitioners who have recently bought books from an elderly book traveller (called Mr. Harris or Matthews) are asked to communicate with either Dr. Shalman, 57, Walsgrave Road, Coventry, or Dr. Hawley, Hazelbeech, Eaton Road, Coventry.

CORRECTION

MESSRS. BAILLIÈRE, TINDALL AND COX have asked us to point out that Dr. Ernest Nicole's book on psychopathology was erroneously described in their advertisement in the *Journal* of October 25th as intended to fill the gap *between the two* books of physiology and psychopathology. Physiology should have been *psychology*.

THE *Appointments Diary* for 1931 issued by the Dental Manufacturing Company, Ltd., Brecl House, Great Portland Street, W., is a handy and well produced desk companion intended for dentists but equally useful in medical consulting practice. The price is 6s. 6d. postage 6d. extra.

VACANCIES

NOTIFICATIONS of offices vacant in universities medical colleges and of vacant resident and other appointments at hospitals will be found at pages 49, 50, 51, 52, 53, 57 and 58 of the advertisement columns, and advertisements relating to partnerships assistantships and locumtenencies at pages 54, 55 and 56.

A short summary of vacant posts notified in the advertisement columns appears in the Supplement at page 22.

EPITOME OF CURRENT MEDICAL LITERATURE.

Medicine.

287 Heart Disease in Middle Life.

Discussing heart disease in middle life, A J Mackenzie (*Canadian Med Assoc Journ*, September, 1930 p 370) ignores cases of late rheumatic endocarditis, syphilitic sclerosis of the aorta, and toxic adenoma, he deals only with those cases of sudden death or physical break-down occurring in apparently healthy, robust individuals Degenerative heart disease manifests in the early period symptoms of four types respiratory, digestive, painful, or oppressive The most frequent symptom is a slight shortness of breath on exertion which gradually becomes more marked and more easily induced. In many cases some discomfort after meals is noted early, this discomfort may pass into actual pain The anginal type merges into that described above commencing with indefinite precordial pain brought on at first by exertion, but which in the early period tends to disappear with exercise. Later on violent or even terminal seizures are likely to occur According to Mackenzie breathlessness is produced by an insufficient output of blood from the heart Pain, on the other hand is due to an insufficient supply of blood to an active part of the heart muscle Its pathogenesis is reviewed The patient s history affords the chief diagnostic aids, since the clinical examination is often disappointing The heart is usually enlarged, but murmurs are not heard in the absence of endocarditis or advanced changes The sounds are liable to be normal reduplication is a serious sign The rhythm is usually regular but extrasystoles are frequently found. Electrocardiograms are of most value in determining the existing state of the cardiac mechanism In most cases the blood pressure is raised Arterio-sclerosis as apparent in the radial and temporal arteries is significant The ill defined pathological changes responsible for the symptoms are briefly described As the disease progresses the symptoms which are enumerated, may be classified under one of three groups definite angina pectoris coronary thrombosis with instantaneous death, or death in a few hours or days, or with life prolonged for months or years and heart *failure, as ordinarily understood Early diagnosis is essential* Rest and an adjustment of the patient's activities are important therapeutic measures, and the removal of foci of infection is advisable Medical treatment will be limited to the correction of disorders of bodily function the assurance of restful sleep and possibly small doses of digitalis Five cases are recorded

338 Intrauterine Transmission of Typhoid Fever

According to E S Wing and D V Troppoli (*Journ Amer Med Assoc* 1930, p 405) although numerous examples have been reported of intrauterine transmission of typhoid, the present is the only case on record in which a mother convalescing from typhoid fever gave birth to a convalescent baby with a positive Widal reaction and typhoid bacilli in the stools Cultures of the mother s breast milk were repeatedly negative In a paper on typhoid fever and pregnancy Hicks and French collected 11 cases in which the infant gave a negative Widal reaction although the maternal blood in each case was positive In another two cases quoted by them typhoid bacilli were found in the foetal tissues and positive reactions were found in the foetal blood, and in yet another case the foetus delivered at necropsy gave a positive serum reaction, but showed no typhoid bacilli The writers maintain that their case supports the view that the foetus produces its own agglutinins

339 Quinsy in Diphtheria.

J F Cordon and D C Young (*Arch Int Med* September, 1930 p 408) draw attention to the danger of incising an apparent quinsy in diphtheria the resulting mortality being extremely high An open lesion favours the absorption of toxin and consequently local applications are avoided because of the importance of preventing any minimal injury to the relatively intact mucous membrane a surgical incision consequently thus a real danger In the differential diagnosis between faucial diphtheria and quinsy antitoxin should be given to any case in which a supposed peritonsillar abscess has been incised without finding any pus and the necessity for incision in a doubtful case is rarely so urgent that the operation cannot be delayed until the results of a culture have been obtained Quinsy occurs in adults more frequently than diphtheria, it is usually associated with a high temperature, which is a valuable diagnostic sign in distinguishing between a pyogenic and diphtheral sore throat Peritonsillar abscess is usually unilateral, whereas a bilateral swelling of the fauces is suggestive of diphtheria Although diphtheria may be accompanied by a concurrent pyogenic infection, incision of the quinsy is not justifiable *without the administration of* antitoxin, and delay beyond twenty four hours in giving antitoxin is almost invariably fatal In spite of the frequency of such secondary infections, the authors record only one case of associated peritonsillar abscess in 3,260 cases of acute diphtheria In this instance the abscess subsided without surgical intervention, which was also not required in three cases in which convalescence from diphtheria was complicated by abscess

340. The Prognosis in Coronary Thrombosis

L A Conner and E Holt (*Amer Heart Journ*, August, 1930 p 705) have attempted to assess the prognosis in coronary thrombosis from the standpoint of those patients who survive the first attack. An analysis has been made of 287 such patients, in all of whom the diagnosis was unquestionable, and who were collected from both hospital and private practice Of this number 85 per cent were males and the incidence according to five year age groups rose steadily from the 30–35 to the 56–60 period It was found, however, that the incidence between the ages of 41 and 45 was higher than in corresponding periods between 61 and 70, and that one-third of all patients had their first attack before the fifty first year Among women a distinctly greater proportion of cases occurred in the later years of life Pre-existing arterial hypertension was recorded in 34 per cent of the patients syphilis in 14 per cent, and diabetes in 10 per cent. Analysis of these groups showed that patients previously suffering from hypertension had the first attack of coronary thrombosis generally at a rather later age while those with evidence of pre existing syphilis were usually affected at a rather earlier age The common belief that the precocious cases of coronary thrombosis frequently have a syphilitic basis was shown to be no longer tenable, since most of the early cases in the authors series showed no evidence whatever of luetic infection Patients previously suffering from diabetes were somewhat concentrated in the age groups between 50 and 60, suggesting visceral arterio-sclerosis as the single underlying cause of both diseases *The immediate mortality in the first* attack was 16 2 per cent *Of the 287 patients studied 117 are still alive and of these 75 per cent were in good health at the end of one year, 56 per cent at the end of two years,* and 21 per cent at five years With regard to antecedent circulatory symptoms, 62 per cent of the patients had had none Two-thirds of the patients had one attack of thrombosis while about a quarter had two three attacks were recorded in 4 per cent, and four to seven attacks in 5 per cent Signs of arterial embolism occurred forty nine times in 42 patients rather more than half of these attacks involving the systemic arteries In general the greater the severity of the initial symptoms the higher was the immediate mortality

Surgery.

391 Hernial Appendicitis

L S Austin (*Med Journ and Record* August 20 h 1930 p 189) reports a case of acute gangrenous hernial appendicitis independent of strangulation occurring in a woman aged 60, with a history of operation for procidentia ten years earlier followed by eight normal pregnancies Two years previously she had noticed a painless irreducible swelling in the right groin which twelve months later became tender and intermittently painful increasing in size during the last six months On examination there was a mass in the right groin lying over Poupart s ligament and extending from about two inches below the anterior superior iliac spine to the pubes It was hard and tender especially in the region of the femoral opening A diagnosis of *strangulated right inguinal hernia was made and an* operation under local anaesthesia was performed On incising the sac a small amount of pus was evacuated this was found to originate in an abscess containing the appendix in the sac of an indirect inguinal hernia. The appendix was adherent to the wall of the abscess cavity from which it was freed its proximal end being adherent to the neck of the sac An appendectomy was performed the

stump being tied and carbolized but not inverted, care was taken not to detach the adhesions at the internal ring A tube between two layers of gauze packings was inserted up to the adhesions at the neck, resection of the redundant tissues of the sac and false membranes was performed The appendix was very thickened and kinked, with a gangrenous area and perforation at its tip The wound closed in nineteen days, and three weeks after discharge from hospital it was completely healed, considerable fibrosis and partial closure of the hernial orifice necessitated a radical cure later Auster remarks that the differential diagnosis rests between an enlarged vas, a lymph node, a strangulated appendix, epiploica a Meckel's diverticulum, an endemic form of inflammation of the vas deferens which is common in Egypt, or an incompletely descended testis In the presence of suppuration any attempt at radical cure of the hernia should be postponed to a later secondary operation The use of packing results in a considerable fibrosis and scar tissue which partially closes the hernia as in the case reported

392 Acute Suppurative Arthritis of the Knee

L PAPIN (*Bordeaux Chirurgical*, October, 1930, p 283) describes acute suppurative arthritis of the knee as a difficult disease to treat successfully on account of the problem of adequate drainage of this joint When anterior and posterior incisions are made to evacuate the pus, adhesions are quickly formed which prevent proper drainage resection or even amputation may be a necessary sequel In a child resection leaves a marked shortening of the limb, and for that reason should be avoided A case is reported of a boy, aged 10 who was treated by means of temporary disarticulation of the knee for suppurative arthritis following osteomyelitis of the knee cap This disarticulation consisted of the division of the patella ligament and sufficient of the lateral ligaments to allow the joint to be fully flexed, in this way free drainage, the exposure of the infected surfaces, and the institution of adequate disinfection were ensured. When the infection subsided rearticulation by extension was carried out Considering the gravity of the condition, the result was successful, although the patient was left with a stiffness of the knee joint which was inevitable after acute suppurative arthritis An autogenous vaccine was found to be of little use

393 Ureterocele

W A DAWLEY (*Arch of Surg*, Sept, 1930, p 458) describes ureterocele as the intravesical bulging of the mucosa of the lower end of the ureter Opinions differ as to whether or not the condition is congenital, but agree in considering that the significant factor is the existence of obstruction at the ureteral meatus Ureterocele may be present at any age, it is rather more common in females than in males Although usually unilateral, it may be present on both sides In early cases the tumour is small and rounded, with a broad base, but in more advanced cases it becomes elongated Urinary calculi, or some degree of cystitis, hydronephrosis, or pyonephrosis, may be associated with it The symptoms vary with the size and position of the tumour, and may be slight or severe according to whether infection is present or not In acute cases there may be severe colicky pain with pyrexia and leucocytosis Diagnosis must be made by cystoscopy or surgical exploration, since there are no pathognomonic symptoms The tumour may be seen at the usual site of the ureteral orifice extending into the bladder cavity Treatment, which must be surgical, ranges from the simple slitting of the cyst with suture of the two mucous layers to complete resection and circular suture of the mucosa In many cases the suprapubic route is chosen for male patients

394 Reduction of Fractures with the Aid of X Rays

IN order to avoid moving the limb during reduction of fractures under *x* ray control, C V BRAMANN (*Zentralbl f Chir*, September 20th, 1930, p 2371) uses two *x* ray tubes placed at right angles to one another Simultaneous screening by two tubes is impossible for technical reasons, but is not really necessary, since the tubes can be switched on alternately Originally there was a mirror at an angle of 45 degrees near the lateral screen so that this could be viewed from above, but reduction has then to be induced by the aid of a mirror image in one plane and by direct vision in the other, this is difficult, and the mirror was therefore discarded In fractures of the lower extremity lumbar anaesthesia is used, and local anaesthesia for those of the upper limb Klapp's temporary wire extension is employed, since it gives good extension and facilitates the application of plaster An unpadded plaster bandage is so applied that an area of about a hand's breadth is left free over the site of the fracture Reduction is performed first from the front and then from the side When alignment is satisfactory in both planes the site of the fracture is covered with two short pieces of plaster, which are joined to the rest of the splinting with one or two plaster bandages, the limb is then left undisturbed until the plaster has set If the limb is swollen a new bandage is applied under *x* ray control after the swelling has subsided If the swelling is very marked, reduction is postponed for a period of not more than ten days, perfect results are obtained even after this long interval The method saves the patient much discomfort, frequent corrections and long periods of extension being unnecessary The number of *x* ray pictures required is also small, and thus the cost is reduced The precise indications are as yet not clearly defined, but, in addition to fractures of the leg and forearm, the method is said to give good results in permanent extension cases such as fractures of the femur, since it is possible to employ the technique with the patient in bed

Therapeutics.

395 Desiccated Stomach in Pernicious Anaemia.

CASTLE and Townsend demonstrated in 1929 the fact that the healthy stomach secretes something that has the power of digesting meat in such a way as to produce a specific blood maturing substance This may be stored in the liver, kidneys, and to some extent in other organs This substance is not secreted by patients with pernicious anaemia, and the inference followed that the failure of the red bone marrow cells to mature in this disease was associated with an inability of the patient to develop the blood maturing substance R ISAACS and C C STURGIS (*Journ Amer Med Assoc*, August 23rd, 1930, p 585) have found, as have Sharp and others, that the gastric tissue, when chopped, dried, and defatted, contains a considerable amount of the active material Dried, defatted hog stomach may be used as a therapeutic agent in inducing and maintaining a remission in patients with pernicious anaemia A remission may be induced with 15 grams of the dried material (corresponding to 100 grams of fresh stomach), and may be maintained with 7 gram doses, a safe clinical dosage is 10 grams for each million red blood cell deficit in the count The maintenance dose is 10 grams, administered from five to seven times a week No gross differences have been noted in the clinical features of liver induced remissions and those induced by stomach therapy There appears to be a definite correlation between the daily dosage and the number of days required for the erythrocyte count to reach normal, but variations appear in individual patients, depending on the previous therapy, the degree of the anaemia, and the state of the blood-forming organs at the beginning of the treatment Beef and calf stomach apparently possess some activity in inducing remissions, and the relative potency of material derived from different parts of these stomachs is being studied

396 Flavouring of Expectorant Mixtures

J F JOHNSTON (*Canadian Med Assoc Journ*, September, 1930, p 412) states that expectorants have a definite but limited place in medicine as palliative, though not curative, agents Cough is a reflex, elicited particularly from the bifurcations of the respiratory tree and the true and false vocal chords The cilia of the tract can only function normally when the mucus bathing it is of normal viscosity True expectorant drugs probably all act reflexly The expectorants in common use are ipecacuanha, antimony, ammonium carbonate and chloride, squills, and senega, but only the first three are here dealt with by the author Ammonium carbonate has been found the most efficient, senega is very unpalatable and hard to cover Ammonium chloride is less efficient than the carbonate, and tends to affect the acid base balance of the blood by breaking up into ammonia and chlorine ions, the former is converted into urea, and the chlorine ions are left free to take up any available base The 20 minim expectorant dose of vinum ipecacuanha, when mixed with 1 drachm of water, is palatable, and the addition of 15 minims of syrup of orange, lemon, tolu, or ginger (according to taste) makes a very agreeable mixture The 20 minim dose of vinum antimoniale tastes less pleasantly than ipecacuanha, but this objection is adequately overcome by adding 15 minims of any of the above mentioned syrups Ammonium carbonate has a very ammoniacal odour and a pungent, burning taste, its adequate dose is 5 grains dissolved in a drachm of water, and the taste is only disguised at all well with syrup of tolu To hide the taste completely additional flavouring agents are necessary, the most satisfactory being fluid extract of liquorice, anise water, and the compound tincture of cardamoms Combinations of two of these expectorants are frequently used, and are advisable In children and diabetics the syrup can be replaced by 1/12 grain of saccharine with no loss of palatability Johnston

adds that expectorant mixtures should be used at frequent intervals when the bronchial flow is scanty when this is established and abundant they can be withdrawn He attributes slight expectorant value to syrup of squills, except when used alone in large doses, it offers little more than an agreeable flavour

357 Antitoxin Treatment of Scarlet Fever

T TOYODA, J MORIWAKI I FUTAGI and S HOSHIZAKI (*Brit Journ Child Dis*, July–September, 1930 p 181) record their observations on the treatment of scarlet fever by antitoxin at the Government Isolation Hospital Dairen Manchuria. Their conclusions were as follows Scarlet fever streptococcus antitoxin reduced the mortality of the disease by half It had a remarkable effect on the symptoms due to streptococcus toxin—namely rash fever itching, vomiting convulsions, and cardiac palpitation While the serum seemed to reduce the incidence of complications, it did not appear to have any effect on complications which had already developed

Laryngology and Otology.

358 Collapse Therapy in the Treatment of Tuberculous Laryngitis

H RETTOUEVEY (*Rev de Laryngol d'Otol et de Rhinol*, July 31st 1930 p 469) reviews the history of collapse therapy in the treatment of pulmonary tuberculosis, and recalls that tuberculous laryngitis was at one time considered to be a contraindication to pneumothorax Later, however it was found that the influence of lung collapse on the laryngeal condition was so favourable that in 1925 Hirschfeld held that laryngeal involvement was an indication for the less drastic methods of collapse therapy Involvement of the larynx by the tuberculous process is brought about by direct inoculation by sputum, blood borne bacilli, or by lymphatic involvement It is claimed that the collapse of an involved lung reduces the amount of sputum and in addition removes the lung to a large extent from the circulation The number of bacilli reaching the larynx is in this way greatly reduced The author records an analysis of a series of 56 cases observed by himself All the patients were resident in public sanatoriums, and the series contains a large proportion of advanced cases In addition to collapse of the lung the laryngeal conditions were treated by the usual methods of inhalation, cautery, and ultra violet light Retrouvey mentions that while it would have been more scientific if the figures had been taken from a series treated by collapse alone it is impossible to withhold any method of treatment from these patients The methods of collapse used were pneumothorax in 45 cases pneumothorax with phrenicotomy in 4 pneumothorax with division of adhesions in 1, and phrenicotomy alone in 6 Ten patients were cured, 3 of whom had extensive disease of the larynx with ulceration, 17 were improved 8 remained unaltered (in 2 only of these cases was the collapse satisfactory), and 17 became progressively worse In these last cases the pneumothorax failed, and the laryngeal and pulmonary lesions extended equally In a review of cases of pulmonary tuberculosis without laryngeal involvement treated by lung collapse it was found that in 1 in 400 tuberculous laryngitis ensued

359 Syphilis of the Middle Ear

THE occurrence of syphilitic otitis media has been denied, but R MAYOUX (*Journ de Méd de Lyon*, July 20th 1930 p 427) states that he has seen many cases of congenital syphilis in which suppurative otitis media and oto-sclerosis were present Earlier writers held that purulent otorrhoea was not entirely local, but was often due to constitutional disease such as scrofula and syphilis Mayoux believes that tuberculous otitis media is common and that syphilis of the middle ear (both congenital and acquired) is not rare Apart from otitis media associated with nasopharyngeal syphilis he refers to the frequency of otorrhoea in congenital syphilitics, at least one-third of the patients suffering from interstitial keratitis have otorrhoea or signs of previous ear disease Syphilitic otitis media is characterized by an insidious onset there being usually neither pain nor fever If any pain is present it is dull and suppuration is delayed but the deafness is sometimes greater than that which follows ordinary middle ear disease This is due to early labyrinthine involvement—a characteristic of syphilis In many cases polypi appear early In both syphilis and tuberculosis the mucosa is infiltrated rapidly and spreading perforations occur sometimes destroying the tympanic membrane in a few days Syphilitic otitis is essentially chronic. Spontaneous cure may occur, but thick fibrous scars, with retraction of the tympanic membrane, and whitish calcareous patches remain Ordinary antisyphilitic treatment is as useless as in interstitial keratitis but local treatment of the otorrhoea is more successful A dry form of otitis is frequently associated with interstitial keratitis These children exhibit old damage to the tympanic membrane, which is retracted and thickened with fibrous bands around the handle of the malleus, but no rhinopharyngeal lesions The Eustachian tube is usually patent and inflation improves the condition When inflammation of the labyrinth is present the deafness simulates that of obstruction Bony conduction is good, and the Rinné test is almost always negative Mayoux remarks that there are few records of suppurative syphilitic otitis media in acquired syphilis Gumma of the tympanum has been observed, and one author found spirochaetes in the discharge from a perforation Tympanic suppuration accompanying labyrinth infection has been seen in secondary syphilis, especially when the tympanic cavity is closed by swelling of the Eustachian mucosa Diagnostic errors may be avoided by remembering tuberculosis and syphilis in every unusual case of otorrhoea syphilitic mastoiditis is rare

360. Conservative Treatment of Chronic Maxillary Sinusitis

H A TROTTER (*Arch of Otolaryngol* July 1930 p 18) summarizes the complications of radical operation on the antrum and pleads for more conservative treatment Anaesthesia of the cheek, death of one or more teeth, and intractable infraorbital neuralgia have all been described as sequels of the radical operation The conservative treatment depends in the first instance on accurate diagnosis of the pathological condition while admitting the limited value of all the usual methods of diagnosis Trotter claims that accurate diagnosis is only rendered possible by visual examination of the cavity For this purpose he uses an instrument built on the cystoscope principle which he calls an antroscope For diagnosis the antronasal wall is trephined, a cannula is introduced and the antroscope is passed through the cannula. For treatment the canine fossa approach is used the mucoperiosteum is infiltrated and incised and the cannula is then introduced into the antrum through the canine fossa The cannula should always be used to avoid soiling the antroscope lens with blood or secretion The antrum is irrigated and a diagnosis is duly made A diathermy electrode is introduced subsequently together with the antroscope and all polypoid masses are systematically dried A counter-opening is made into the nose, and the antrum is irrigated daily with boracic lotion Trotter claims that his operation is bloodless, shock is negligible and convalescence rapid In addition, the many unfortunate sequels of radical operation are avoided

Obstetrics and Gynaecology.

361 Intracranial Haemorrhage in the Newborn

SINCE intracranial haemorrhage in the newborn greatly concerns the obstetrician I C IRVING (*New England Journ of Med* September 11th, 1930 p 499) deals with this condition from the obstetrical aspect The cardinal sign of intracranial haemorrhage is a disturbance of respiration, and the failure to establish spontaneous respiration in a reasonable time is strongly suggestive of intracranial vascular damage. The method of resuscitation most frequently used is mouth to mouth insufflation By this simple method the lungs undergo their primary expansion, and at the same time the infant derives benefit from the carbon dioxide in the operator's breath All violent methods of inducing respiration may do great harm Later symptoms are apathy refusal to take the breast, pallor, and a tensity of the anterior fontanelle Spasm and paralysis may or may not be present If present the diagnosis is practically certain Nystagmus often occurs but is not pathognomonic. Sometimes the infant has a peculiar high pitched, insistent cry, which is characteristic and corroborates the diagnosis The frequency of intracranial haemorrhage is shown by the fact that out of 182 necropsies 73 (40 per cent.) revealed this condition as the cause of death Intrauterine asphyxia may be a direct or predetermining factor as may other conditions in neo-natal intracranial haemorrhage It may result from various factors but usually depends on interference with the foetal circulation The prevention of this haemorrhage is by far the most important aspect Irving shows that the risk is less in Caesarean sections and normal deliveries and almost equally small in low forceps operations In the last named instance forceps are applied if the head has been on the perineum for two hours preceding the operation by a free episiotomy Breech deliveries are best avoided by preliminary external version or by Caesarean section If inevitable they should be conducted with the utmost gentleness Mid forceps operations

are decidedly dangerous High forceps deliveries, also dangerous, are rarely performed now D Munro (ibid, p 502) believes that the diagnosis of intracranial haemorrhage of the newborn should be expanded to include cerebral oedema and fracture of the skull In the presence of surgical shock, the symptoms of which are detailed, treatment should be reduced to the absolute minimum A study of 117 cases of cranial and intracranial injury in the newborn is presented.

402 Vesico-abdominal Fistula complicating Labour

H Acosta-Sison (*Amer Journ of Obstet and Gynecol*, August, 1930, p 239) records two cases of vesico abdominal fistula following labour in a primipara The first patient, aged 21, had had pyrexia and frequent micturition for a month before her labour, which was accompanied by impaction of the occipito posterior head on the perineum, and terminated by low forceps extraction of a living child Dysuria followed with persisting fever Catheterization gave small amounts of urine containing pus, and on the fifth day a pear shaped cystic hypogastric tumour was noted The patient urinated spontaneously, and fluid introduced into the bladder was returned, so that at first the diagnosis was obscure, the tumour being taken for the subinvoluted uterus Death ensued on the twenty eighth day, and at the necropsy a large sac, containing pus and urine, and shut off from the general abdominal cavity by fibrinous exudate, was found to communicate with the shrunken bladder by a perforation on the anterior wall near the fundus In the second case the perforation, in the same part of the bladder, had not completely extended through the serosa, and was discovered at necropsy There had been prolonged impaction of the head in the pelvic cavity The cause of the vesico abdominal fistula in both cases was pressure necrosis of the bladder, such a fistula as a sequel to labour is very rare

403 Primary Syphilis of the Vagina

M Kazarowa (*Urol and Cut Rev*, September, 1930, p 591), who records an illustrative case, quotes several authorities testifying to the rarity of primary syphilis of the vagina Fournier, who had seen only one case, attributed the infrequency of vaginal chancre to the anatomical structure of the organ which possesses a thick connective tissue layer with abundantly embedded elastic fibres and a very thick lining epithelium Moreover, owing to its extensibility, it is not liable to be torn during coitus Possibly the vaginal secretion acts also as a mechanically protective mechanism against infection Subsequent authors, however, have drawn attention to the difficulty in diagnosing chancre of the vagina owing to the smallness of the lesion, its slight degree of hardness, and its transient duration Kazarowa's patient was a woman, aged 37, in whom the chancre, which was situated on the right vaginal wall, was of an unusually large size, but of soft consistency Typical spirochaetes were found in the serous exudation from the chancre The vaginal glands were enlarged on both sides, and a fully developed generalized papular rash was present.

404 Causation of Labour

M L Peretz (*Zentralbl f Gynäk*, August 2nd, 1930, p 1937) in a preliminary communication reports that in more than one half of fifty pregnant patients who had passed the calculated term of labour, labour quickly followed the intravenous injection of 50 to 300 c cm of citrated blood taken from other patients towards the culmination of parturition The inference that this effect was due to a hormone is supported by the fact that in a series of twenty five control cases the injection of blood taken from non parturient patients proved ineffective.

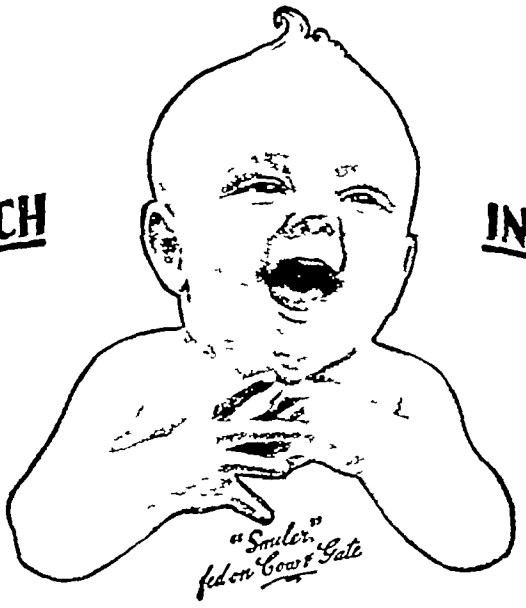
Pathology.

405 The Characters of Different Strains of Leptospirae

J. E Dinger and F Virschaffelt (*Ann de l'Inst Past*, September, 1930, p 396) have studied three new strains of leptospirae, and have observed marked differences between them The first strain (Wa Gent) was isolated by Bessemans and Thiry from tap water in Ghent, and was found by them to be pathogenic for mice (see *Epitome*, 1929, vol i, para 145) The present authors, after purifying the strain, found that it was completely avirulent to mice Serologically it was distinct from *icterohaemorrhagiae* and from *hebdomadis* strains, but it showed some relationship to one of the water strains in their possession They concluded that it was an ordinary aquatic strain, and that the results of Bessemans and Thiry were probably falsified by a pre existing latent infection of their mice with a pathogenic leptospira The second strain (Muis Gent) was cultivated from the kidneys of white mice which were naturally infected with leptospirae, these mice had been sent from Ghent This strain proved slightly pathogenic for white mice, after intraperitoneal inoculation the mice excreted the organisms in the urine about a fortnight later, and some of them died It was of *moderate* virulence to guinea pigs, many of which died with typical haemorrhages in the lungs Serologically it proved entirely distinct The third strain was recovered from an *epidemic* at Moscow of so called "mud fever"—an epidemic disease occurring in the flooded areas of Silesia It was slightly virulent for guinea pigs and avirulent for mice, serologically it was distinct. This strain is of particular interest, because it is the first pathogenic strain for man which has been recovered in Europe and which differs from *L. icterohaemorrhagiae* A study made of a strain of this latter organism from Weil's disease proved it to be highly pathogenic for guinea pigs, and fairly pathogenic for mice The comparative fixity of the strains of leptospirae studied by the authors is regarded by them as rendering unlikely the hypothesis that the common aquatic types are able to become virulent for man by progressive adaptation

406 Bacteriology of Chronic Epidemic Encephalitis

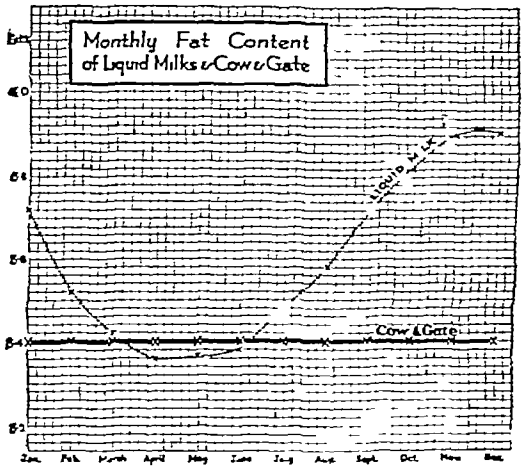
W B Stewart and M J Evans (*Amer Journ Med Sci*, August, 1930, p 256) examined the nasopharyngeal cultures of 114 cases of chronic epidemic encephalitis and 37 controls, and found the Pfeiffer bacillus in 100 per cent of the former and in only 46 per cent of the latter The serums of the chronic encephalitis patients agglutinated the Hammett strain of the Pfeiffer bacillus in 100 per cent of 165 cases studied, the agglutination titres ranging from 1 in 20 to 1 in 640 Flocculation tests were also invariably positive with these serums, the titres ranging from 1 in 20 to 1 in 160. No other organism tested was consistently agglutinated by chronic encephalitis serums Of 20 cases of chronic encephalitic Parkinsonism examined for sinus disease 18 gave positive results either by x rays or clinical examination, and 13 of these had definite disease of the ethmoids. Of 46 cases of chronic Parkinsonism treated for a month or more by a soluble antigen of a virulent strain of the Pfeiffer bacillus, 78 per cent showed some improvement, as indicated by a definite decrease in extrapyramidal rigidity



407 Ultra violet Radiation and Loss of Weight.

A R Harris (*Journ Exper Med*, August 1st, 1930, p 253), using six comparable groups each containing ten rabbits, exposed three of the groups for an hour each day to the unfiltered radiations of a quartz mercury arc lamp (80 volts, 4 2 amperes) at a distance of 4 5 metres, the other rabbits being kept in total darkness, the irradiated rabbits showed at first a more rapid rate of gain in weight than the non irradiated ones, but after this initial period of rapid increase the irradiated animals maintained a lower body weight than the others In groups inoculated with *Trep pallidum* the irradiated animals maintained a lower weight than those living in total darkness The mortality rate from pneumonic infection was found to be greater in animals exposed to ultra violet radiation than in the controls The author concludes that, under the conditions given, ultra violet radiation was detrimental rather than beneficial

408 Production of Typhoid Agglutinins in Rabbits.



C. A Behrens and C H Kimpler (*Journ Immunol*, September, 1930, p 321) have endeavoured to ascertain the best method of producing typhoid agglutinins in rabbits. Working with a suspension of typhoid bacilli killed by heat at 58° C for one hour, and standardized to 2,000 million per c cm, they varied as far as was practicable the size of the individual dose, the frequency of injections, and the total dosage. All inoculations were made intravenously, and the rabbits were bled on the ninth or tenth day following the last injection Generally speaking a close relation was found between the size of the individual dose and the frequency of injection, the total dosage had much less effect For example, good results were obtained by ten inoculations on a single day of 0 1 c cm at hourly intervals, by one inoculation on alternate days of 1 c cm on six to ten occasions, and by one inoculation every eight to ten days of 5 c cm on eight to ten occasions The first method gave an average titre of about 1 in 5,000, the second 1 in 6,000, and the third 1 in 18,000 It is noteworthy that the highest titres were obtained with the largest doses, but on the other hand these required a long time (two to four months) for their production The conclusion appears to be that if a serum of moderate titre is required rapidly, the most expeditious method is to give ten doses of 0 1 c cm on a single day, while if a high titre is required 5 c cm doses should be given every eight or ten days for about twelve weeks Incidentally it may be noted that, whatever the methods used, non specific agglutinin formation was negligible.

NATURALLY RICH

IN VITAMIN "D"

A RELIABLE BASIS

THE above chart shows the large fluctuations in the fat content of liquid milks throughout the year, as compared with the unvarying fat content of "Cow & Gate," which is based on the fat content of average healthy Breast Milk.

Fat content in 'Cow & Gate' reconstituted (1 in 8), 3.4 per cent.

Fat content in average Breast Milk 3.3 per cent. to 3.5 per cent.

The fat content of raw milk also varies greatly from day to day. The time of day at which milking takes place also causes considerable variations.

This is in striking contradistinction to the standardized fat content of "Cow & Gate" and affords one of the many reasons why this food is the safest and most reliable alternative when breast feeding fails, and why it affords the most reliable basis for Infant Feeding Modifications.

DEAF DOCTORS
AND DEAF PATIENTS

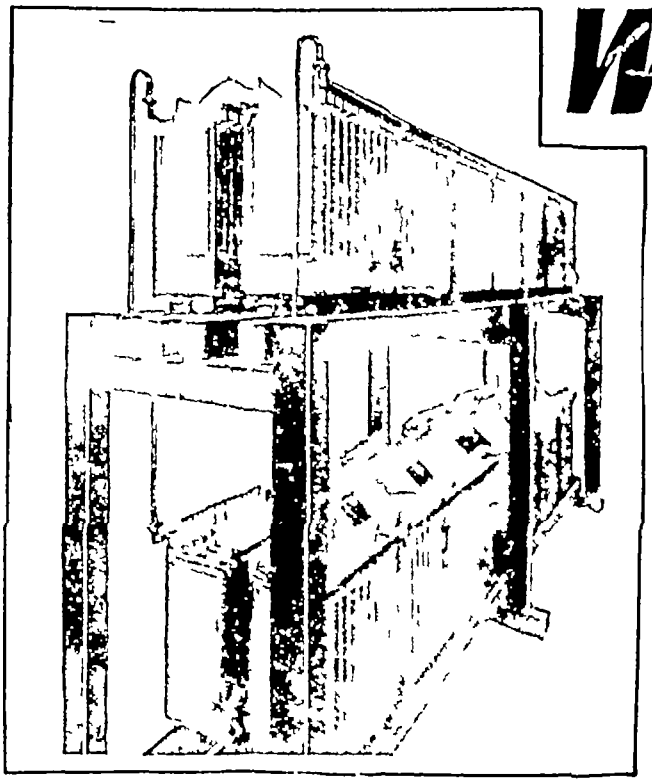
have proved "ARDENTE a boon—a Heart Specialist whose work is so dependent on his hearing writes

Ardente' is a godsend to me

without "ARDENTE he is to all intents and purposes "stone" deaf with 'ARDENTE' he carries on his work—what better testimony to 'ARDENTE" merit?

Mr Dent makes a Stethoscope specially for deaf Doctors—the only one of the kind which is widely used and praised. Doctors who work lies among the deaf prefer to prescribe ARDENTE because they know that ARDENTE is the only individual method in the whole deaf world (no mass production way can ever succeed with human deafnesses) and they know what ARDENTE service stands for to the deaf. Many doctors who are deaf use ARDENTE"

ARDENTE" is entirely different and unequalled and succeeds in widely differing cases A full range covers the needs of those suffering from varying forms and degrees of deafness and tinnitus Minutely adjusted to the requirement of the case for young middle-aged or old and so sensitive as to have the desired effect even in middle-ear and nerve cases Listening into action and stimulating the auditory system enabling it to function naturally and saving atrophy "ARDENTE" can be used or not at will and is sold under guarantee



ARDENTE" is the choice of Doctor and patient—only after test and hearing or from prescription or particulars is "ARDENTE" fitted tested tried adjusted supplied and serviced

Tests and demonstrations given at Doctors patients or our addresses, without fee or obligation.

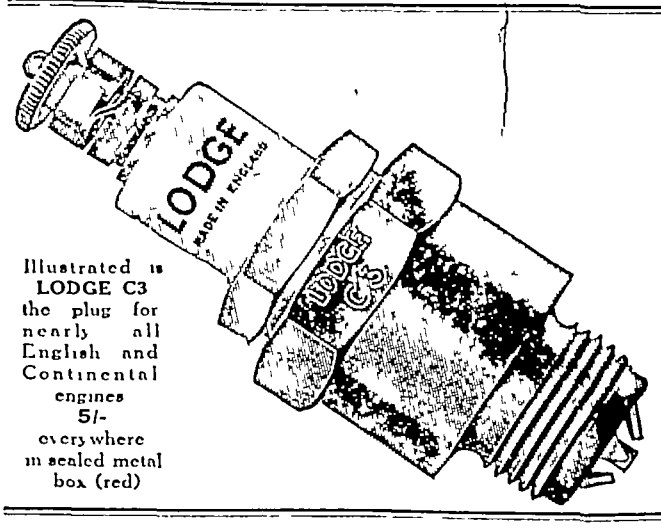
When a life is at stake....

The psychological moment has arrived Will the operation be successful? Can modern science triumph over such disease The surgeon bends closer over the table deft fingers touching slender instruments a life is at stake if the lights should fail, plunging the theatre into darkness



Nowhere is reliable light supply more important than in operating theatres A light failure may have far reaching consequences Every hospital should be equipped with Ediswan Stationary Battery Then if current fails, a switch over to the Ediswan saves the situation and restores light almost immediately

The Ediswan Stationary Battery for Emergency Lighting is compact and robust It takes up little space and is sturdily built to give long service Running costs are almost negligible Installation costs are low

May we co operate with you in evolving a Battery specially to suit your requirements?

THE POSTAL ACCOUNT

It is often supposed that to live a long way from the nearest branch of a bank, or to be constantly unable to go to the bank in person, is a handicap to the enjoyment of the full advantages which, it is admitted, a banking account offers Perhaps it is assumed that to conduct an account by post involves 'more letter writing', or is costly, or is not welcomed by the Bank It is the aim of the Westminster Bank to dispel such misconceptions by a leaflet entitled *The Postal Account*, which explains the convenience of the method, and offers some clear suggestions

The Secretary of the Bank will be pleased to send a copy on application

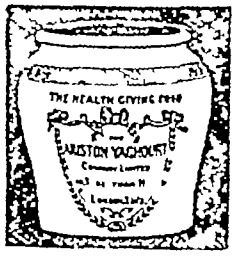
"The Rose Corset-Belt"



for Accurate Abdominal Support and Comfort

Extract from the "British Medical Journal," Dec 10th, 1927—

Visceroptosis is the cause of so much discomfort and ill health and an ill fitting or wrongly applied belt or corset may aggravate rather than diminish the subjective effects of this condition Madame Rose has for many years devoted special attention to this problem and we have good reason to believe that she has given help and comfort to a considerable number of sufferers We have received assurances from medical men who have sent patients to her, that she gives personal attention to each patient, that she takes great care in adapting and adjusting the support to the particular needs of the case

Completely rebuilt and modernised *in summer 1930* and provided with every facility for the convenience of patients. All rooms have running hot and cold water and all front rooms in addition are provided with private bathrooms and lavatories. House and international telephone connections are installed in every room. Light signals instead of bells throughout the house. The new private balconies are of the most modern construction.

Terms from £5 12 0 per week

Medical Supt. BERNARD HUDSON, M.A., M.D. Cantab., M.R.C.P. Lond., Swiss Federal Diploma.

THE HARROGATE FOAM BATH

THIS is a new development in treatment in which Harrogate Natural Sulphur Water is used in the form of foam with air, oxygen or carbon dioxide. This bathing medium has a density of only one per cent. of that of water. The negligible hydrostatic pressure makes it suitable in heart cases, in arterio-sclerosis and other disorders of the vascular system. Exhaustion is completely absent. The only sensations are of comfort and refreshment.

The thermal non-conductivity of the foam leads to profuse sweating and increased metabolism.

Indications: Obesity, Gout, Arthritis, and other rheumatic affections, such as Fibrositis and Lumbago.

Pullman and Fast Restaurant Car Trains daily from King's Cross Station, London

Medical and "lay" brochures with details of Complimentary Facilities offered to the Medical Profession, free upon application to F. J. C. Broome, General Manager, 3 The Royal Baths, Harrogate.
